| HCPCS | Count   | Count among the 103,750<br>Included Injections | Description  |
|-------|---------|--|--|
| 62311 | 144,169 | 120,487  | Lumbar epidural  |
| 64483 | 41,340  | 35,560   | Lumbar or sacral transforaminal epidural injection, with imaging guidance, 1 <sup>st</sup> level |
| 62323 | 22,119  | 20,106   | Lumbar/Caudal epidural with imaging guidance   |
| 64484 | 5,946   | 5,094  | Lumbar or sacral transforaminal epidural injection, with imaging guidance, each additional level |
| 62322 | 1,553   | 1,066  | Lumbar/Caudal interlaminar epidural without imaging guidance                                     |
|       |         |  |  |
| J1040 | 41,509  | 41,385   | Methylprednisolone 80 mg   |
| J1030 | 14,179  | 14,094   | Methylprednisolone 40 mg   |
| J2930 | 200     | 118  | Methylprednisolone sodium succinate, up to 125 mg  |
| J2920 | 173     | 152  | Methylprednisolone sodium succinate, up to 40 mg   |
| J1020 | 24      | 24   | Methylprednisolone 20 mg (Depo-Medrol)   |
| J3301 | 40,232  | 40,016   | Triamcinolone acetonide (Kenalog)  |
| J3302 | 57      | 57   | Triamcinolone diacetate  |
| J3300 | 56      | 56   | Triamcinolone preservative free  |
| J1100 | 14,754  | 14,658   | Dexamethasone sodium phosphate   |
| J0702 | 4,003   | 3,986  | Betamethasone (Celestone)  |

## Table A. The Healthcare Common Procedure Coding System Codes Included in the Study

The percentages of the epidural steroid injections being the 5<sup>th</sup> or more were 2.26% for the two transforaminal only codes of 64483 or 64484 (95% Bonferroni adjusted confidence interval 1.91% to 2.64%); 1.95% for the interlaminar code of 62322 (0.48% to 5.11%); and 1.82% for the two older codes 62311 and 62323 (1.66% to 1.99%). Comparing the 481/21,318 for 64483 or 64484 versus 10/ 512 for 62322, there was no significant difference by Fisher's exact test (P = .764).

None of the rare injectable steroid types influenced results, even if they were errors in recording what subtype of that steroid was used.

## Table B. STROBE Statement—Checklist of items that should be included in reports of cohort studies, with page numbers being that of the uploaded Word file

|                              | Page | Recommendation  |
|------------------------------|------|---|
| Title and abstract           | 2    | (a) Indicate the study's design with a commonly used term in  |
|                              |      | the title or the abstract   |
|                              |      | (b) Provide in the abstract an informative and balanced   |
|                              |      | summary of what was done and what was found   |
| Introduction                 |      |   |
| Background/rationale         | 4    | Explain the scientific background and rationale for the   |
|                              |      | investigation being reported  |
| Objectives                   | 4    | State specific objectives, including any prespecified hypotheses  |
| Methods                      |      |   |
| Study design                 | 6    | Present key elements of study design early in the paper   |
| Setting                      | 6    | Describe the setting, locations, and relevant dates, including<br>periods of recruitment, exposure, follow-up, and data<br>collection   |
| Participants                 | 6    | <ul> <li>(a) Give the eligibility criteria, and the sources and methods<br/>of selection of participants. Describe methods of follow-up</li> <li>(b) For matched studies, give matching criteria and number</li> </ul>  |
|                              |      | of exposed and unexposed  |
| Variables                    | 6    | Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable  |
| Data sources/<br>measurement | 6    | For each variable of interest, give sources of data and details<br>of methods of assessment (measurement). Describe<br>comparability of assessment methods if there is more than<br>one group   |
| Bias                         | 7    | Describe any efforts to address potential sources of bias   |
| Study size                   | 6    | Explain how the study size was arrived at   |
| Quantitative variables       | 7    | Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why  |
| Statistical methods          | 7    | (a) Describe all statistical methods, including those used to control for confounding   |
|                              |      | (b) Describe any methods used to examine subgroups and interactions   |
|                              |      | (c) Explain how missing data were addressed   |
|                              |      | (d) If applicable, explain how loss to follow-up was addressed  |
|                              |      | ( <u>e</u> ) Describe any sensitivity analyses  |
| Results                      |      |   |
| Participants                 | 9    | <ul> <li>(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed</li> <li>(b) Give reasons for non-participation at each stage</li> </ul> |
|                              |      | (c) Consider use of a flow diagram  |

| Descriptive data  | 19  | <ul> <li>(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders</li> <li>(b) Indicate number of participants with missing data for each variable of interest</li> <li>(c) Summarise follow-up time (eg, average and total amount)</li> </ul> |  |
|-------------------|-----|--|--|
| Outcome data      | N/A | Report numbers of outcome events or summary measures over time   |  |
| Main results      | 1   | <ul> <li>(a) Give unadjusted estimates and, if applicable, confounder-<br/>adjusted estimates and their precision (eg, 95% confidence<br/>interval). Make clear which confounders were adjusted for<br/>and why they were included</li> <li>(b) Report category boundaries when continuous variables</li> </ul>                |  |
|                   |     | were categorized<br>(c) If relevant, consider translating estimates of relative risk<br>into absolute risk for a meaningful time period  |  |
| Other analyses    | 1   | Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses   |  |
| Discussion        |     |  |  |
| Key results       | 11  | Summarise key results with reference to study objectives   |  |
| Limitations       | 12  | Discuss limitations of the study, taking into account sources<br>of potential bias or imprecision. Discuss both direction and<br>magnitude of any potential bias   |  |
| Interpretation    | 13  | Give a cautious overall interpretation of results considering<br>objectives, limitations, multiplicity of analyses, results from<br>similar studies, and other relevant evidence   |  |
| Generalisability  | 11  | Discuss the generalisability (external validity) of the study results  |  |
| Other information |     |  |  |
| Funding           | 1   | Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based  |  |

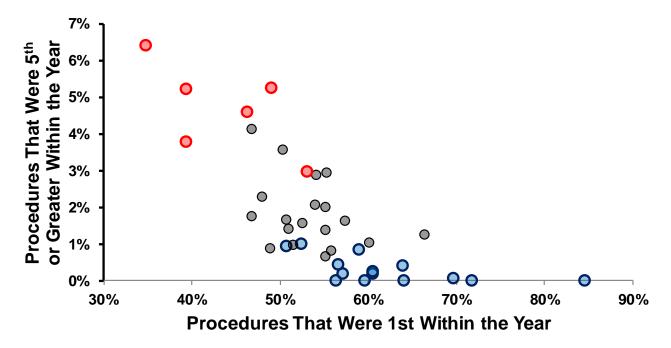

Figure A. Negative correlation among the 39 hospitals between the percentages of steroid injections that were i) the 5th or greater during the year and ii) 1st within the year.

The figure includes the 39 hospitals in Iowa performing overall at least 1 such injection every 4 days. The colors are the same as Figure 2. Specifically, there were 14 hospitals (in blue) with the prevalences of 5th or greater injections significantly smaller than the overall prevalence. There were 6 (in red) with significantly greater than the overall prevalences. The Spearman rank correlation for the association shown in this Figure A was 0.792 (SE 0.067), P < .00001. Among the 6 hospitals that were outliers (red), the median percentage of injections that was the patient's 1<sup>st</sup> for the year was 42.9%. In contrast, at the hospital with the one accredited pain medicine fellowship in the state, the prevalence was 63.9%. As explained in the legend of Figure 2, that training program had 0.4% of its injections that were the 5<sup>th</sup> or greater (N=10/2589), not significantly different from the 0.1% (N=3/2087, Fisher's exact test P=.16) reported by Mayo Clinic<sup>8</sup> and 0.4% (N=2/540, P=.99) reported by Wooridul Spine Hospital, Seoul, Korea.<sup>24</sup>.
