

A. Minute ventilation

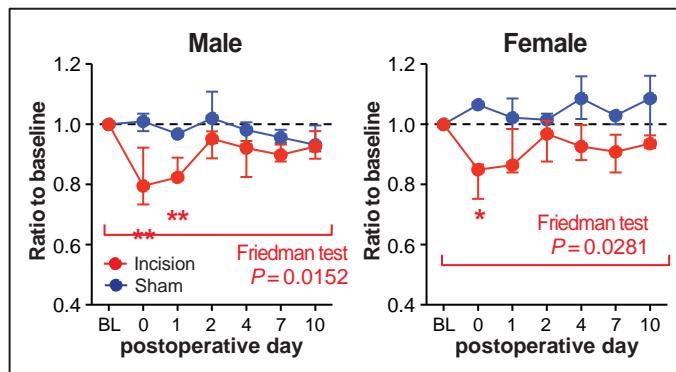

B. Breathing frequency

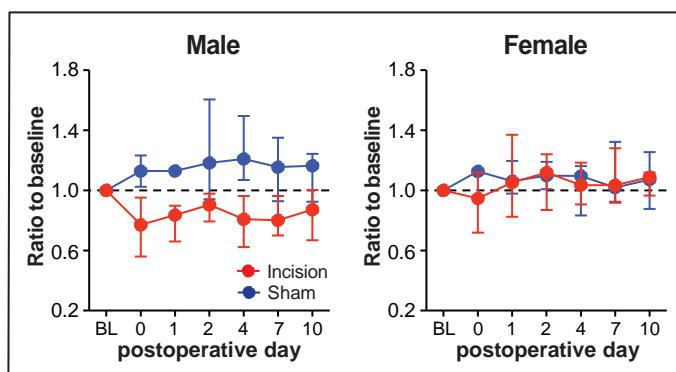

C. Tidal volume

D. I:E ratio

E. EF50

F. Body weight

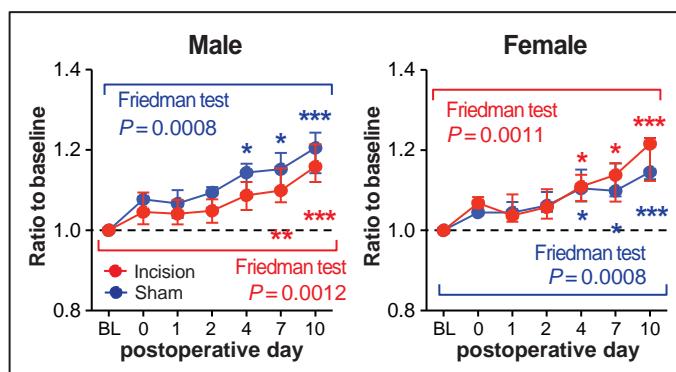

Figure S9. Subgroup analysis by sex: the effect of upper abdominal incision (“Incision” group) vs. sham incision (“Sham” group) on ventilatory parameters (Protocol C). **(A-E):** Ventilatory parameters measured using the whole-body plethysmography system included minute ventilation (B), breathing frequency (C), tidal volume (D), inspiratory-to-expiratory time ratio (I:E ratio; E), and expiratory flow at 50% expired volume (EF50; F). **(G):** Body weight measured throughout the experimental period. Data are presented as median with interquartile range. Sample sizes are given in (A). * $P < 0.05$; ** $P < 0.01$; *** $P < 0.001$ vs. Baseline by Friedman test followed by *post hoc* Dunn’s multiple comparison tests. BL = baseline.
