[†]One Way ANOVA except for Figure 1A analyzed using Log-rank test

*Chauvenet's (normal distribution of the data) or Pierce's (non-normal distribution of the data) criterion were used for data exclusion (as explained in Taylor JR: An Introduction to Error Analysis. The Study of Uncertainties in Physical Measurements, 2nd ed. University Science Books, Mill Valley CA, USA, 1997). Briefly, an outlier is a single observation far away from the rest of the data, i.e. less than $Q_1 - (1.5 \times IQR)$ or greater than $Q_3 + (1.5 \times IQR)$, where Q_1 and Q_3 are the first and third quartiles, respectively, and IQR is the interquartile range (equal to $Q_3 - Q_1$).
