

Table 1

Early Terminated Studies

Animal ID #	Operative date	Study duration	Reason for Termination
424	03/17/11	1	Acute respiratory distress syndrome, hypoproteinemia, excessive serosanguinous chest drainage.
1347	09/17/13	0	Failure to recover; anesthesia and ventilation technical problems.
1348	12/03/13	0	Heart fibrillation following unsuccessful de-airing of the pump.
1227	02/11/14	0	Acute respiratory failure shortly after surgery.
5247	02/17/15	0	Excessive bleeding during surgery (prior to LVAD implantation) caused by an incidental surgical complication.
5248	02/24/15	1	Excessive bleeding post-operatively; the source appeared to be the de-airing hole in the outlet graft.
2225	11/03/15	0	Electively terminated during surgery (prior to LVAD implantation) due to a prolonged period of bradycardia and hypotension following administration of amiodarone given prophylactically to prevent heart fibrillation.

NOTE. All animals were intended as LVAD studies. Two were terminated prior to LVAD implantation.
