

**Figure e-1. Trajectory of Unidentified Bright Objects (UBOs) as a Function of Age in Children with NF1**

**A.** Spaghetti plot depicting the individual trajectories of unidentified bright objects (UBOs) as a function of patient age, in years, for all study participants who harbored T2-hyperintensities (T2Hs) on brain MRI (n=64). **B.** Estimated regression curve generated from a quadratic polynomial regression model fit for natural log transformed counts of UBOs;  $UBO\ Count = 1.3971 + (0.1067 \cdot age) + (-0.0079 \cdot age^2)$ .

**Figure e-2. Trajectory of Probable Tumors as a Function of Age in Patients with NF1**

Maximum is approximately at 11 years of age (based on average pattern).

**A.** Spaghetti plot depicting the individual trajectories of probable tumors as a function of patient age, in years, for all study participants who harbored T2-hyperintensities (T2Hs) on brain MRI (n=64). **B.** Estimated regression curve generated from a quadratic polynomial regression model fit for natural log transformed counts of probable tumors; Probable Tumor Count =  $-0.0661 + (0.1193 \cdot \text{age}) + (-0.0054 \cdot \text{age}^2)$ .
