\*All models are stratified by birth year and control for non-white race, education, current and former smoking (time varying), and current and former alcohol consumption (time varying). Results are for exposure estimates are with addition of background exposure, lag 0, starting in 1952 or at age 20 years (whichever is latest), excluding people born before 1920. The referent group for the quintile analysis is the quintile 1. Quintiles for cumulative exposure had the following cut points (in  $\mu\text{g}/\text{ml}\cdot\text{yr}$ ): 0.0001-<0.1147, 0.1147-<0.2022, 0.2022-<0.4973, 0.4973-<2.676, 2.676-97.396. Quintiles for yearly exposure had the following cut points (in ng/ml): 0.1061-<4.7424, 4.7424-<8.4889, 8.4889-<21.583, 21.583-<100.14, 100.14-3303.3.

\*\*controlling for gender and interaction between gender and time.

\*All models are stratified by birth year and control for non-white race, education, current and former smoking (time varying), and current and former alcohol consumption (time varying). Results are for exposure estimates with addition of background exposure, lag 0, starting in 1952 or at qualifying year or at age 20 years (whichever is latest), excluding people born before 1920. The referent group for the quintile analysis is the quintile 1. Quintiles for cumulative exposure had the following cut points (in  $\mu\text{g}/\text{ml}\cdot\text{yr}$ ): 0.0006-<0.1450, 0.1450-<0.2567, 0.2567-<0.6523, 0.6523-<3.382, 3.382-97.396. Quintiles for yearly exposure had the following cut points (in ng/ml): 0.3184-<5.4263, 5.4263-<11.072, 11.0720-<28.223, 28.223-<125.36, 125.36-3303.3.

\*\*controlling for gender and interaction between gender and time.
