

Supplemental Figure 1. Comparison of Serum GM-CSF Ab levels between CD Smokers, Ex-smokers, and Non-smokers. The Log10 transformation of serum GM-CSF Ab ($\mu\text{g/ml}$) are shown for the NIDDK cohort, the Brisbane cohort, and the combined cohort stratified by smoking status. The middle line represents the median, and the lower edge and the upper edge of the box represent the 25% and 75% quartiles. The bottom and top lines represent the minimum and maximum values, respectively. For the Brisbane cohort there were 224 CD subjects. For the NIDDK cohort there were 253 CD subjects. Kruskal-Wallis with Dunn's post-test revealed significant differences between Smoker and non-smoker CD subjects in the Brisbane cohort and the combined cohort.
