

Supplemental data – sFigure 1

Supplemental Figure: sFigure. 1. **Prevalence of Foxp3- or RORgt-expressing cells in CD25⁺ or CD25⁻ T cell populations after FACS sorting.** CD25⁺ and CD25⁻ populations were selected from CD4⁺ T cells isolated from peripheral blood. After sorting, expression of Foxp3 and RORgt were determined in each population to confirm the purity of extracted Treg cells in the CD25⁺ population and to ensure depletion of Treg cells in the CD25⁻ population. Data shown are typical plots of samples before (left panel) and after (middle panel and right panel) sorting. Sorted cells were used for the Treg generation assay in Figure. 4 and for the Treg function assay in Figure. 5.
