

Figure, Supplemental Digital Content 2. MADRS Response Rate (A) and Remission Rate (B) in the Open-Label Period (LOCF, ITT Population)

MADRS response was defined as a $\geq 50\%$ total score improvement from baseline. MADRS remission was defined as a total score ≤ 10 . Response and remission were analyzed descriptively in the open-label intent-to-treat population based on observed cases. ITT, intent-to-treat; LOCF, last observation carried forward approach; MADRS, Montgomery-Åsberg Depression Rating Scale.
