

Supplementary Figure 3. Percent of children enrolled into surveillance system that tested positive for rotavirus, by calendar week, and timing of rotavirus season in 2009, 2010 and 2011, 3 sites combined *.

*For Mapulaneng/Matikwane, data were available beginning May 2009. Because of a labour strike, surveillance was not performed at 3 hospitals for approximately 2 weeks in August 2010. Data from surveillance conducted in the previous and subsequent weeks were used to estimate rotavirus detection rate for the weeks of the strike.
