

Figure, Supplemental Digital Content 3. Distribution of classical monocytes during PICU stay a) in all patients (n=37); b) in patients admitted for sepsis (n=12); c) in post-surgery patients (n=11); and d) in trauma patients (n=10). On admission, the percentage of classical monocytes in all patients was higher (95%, IQR 88-98%) compared to controls (87%, IQR 85-90%). a-d: Horizontal line indicates the median value, box represents IQR, and the whiskers represent 95% CI. *p-value<0.05, **p-value≤0.01, ***p-value≤0.001. X-axis 1, 2, 3, 4 represent admission, day 2, day 3, day 4, respectively.
