

### Sensitivity Analysis on

IHR\_nl\_hip

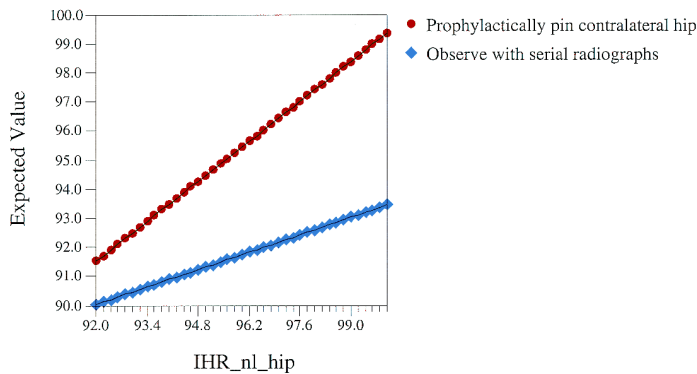

Fig. E-1

Sensitivity analysis on IHR\_nl\_hip. The lines do not intersect, indicating that there is no effect on the results of the model within the plausible range of the variable. (The values on the axes represent the ranges of the variables in the sensitivity analysis.)

### Sensitivity Analysis on

p\_AVN

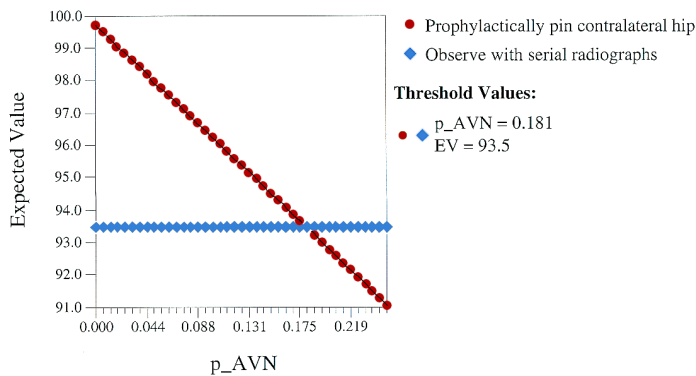

Fig. E-2

Sensitivity analysis on p\_AVN. The intersection or “toss-up” state occurs at a rate of avascular necrosis with prophylactic pinning that is much higher than reports in the literature suggest. (The values on the axes represent the ranges of the variables in the sensitivity analysis.)

### Sensitivity Analysis on

p\_chondrolysis

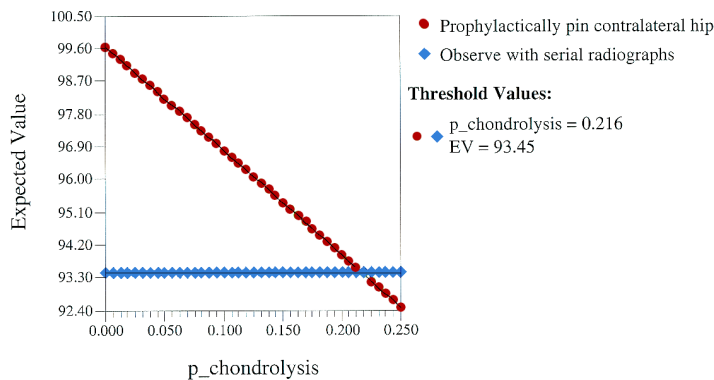

Fig. E-3

Sensitivity analysis on p\_chondrolysis. The intersection or “toss-up” state occurs at a rate of chondrolysis with prophylactic pinning that is much higher than reports in the literature suggest. (The values on the axes represent the ranges of the variables in the sensitivity analysis.)

### Sensitivity Analysis on pslip\_at\_follow\_up

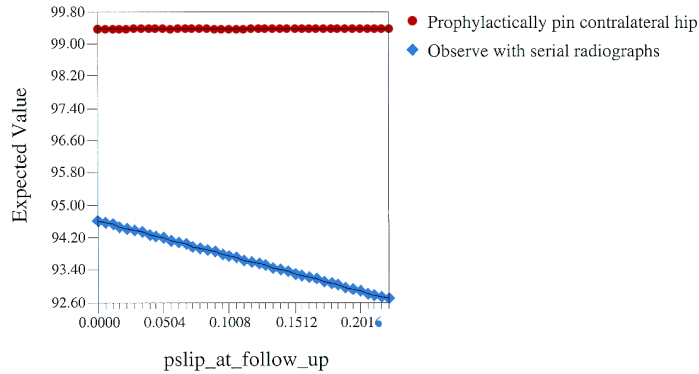

Fig. E-4

Sensitivity analysis on pslip\_at\_follow\_up. Changing the probability for development of a slip during adolescence, in isolation, has no effect on the outcome of the model (a slip may still occur outside of follow-up). (The values on the axes represent the ranges of the variables in the sensitivity analysis.)

### Sensitivity Analysis on pslip\_outside\_fu

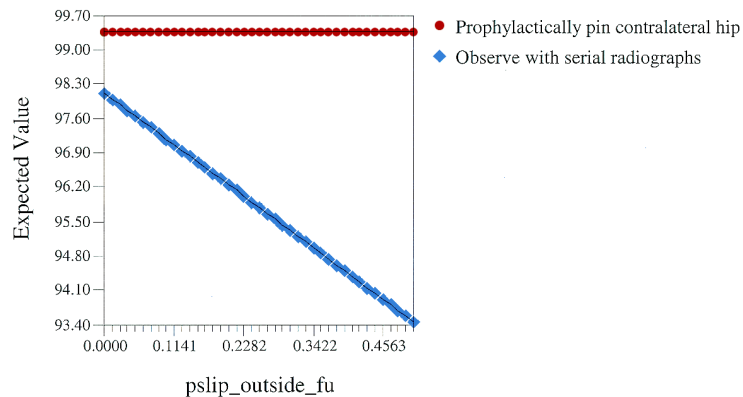

Fig. E-5

Sensitivity analysis on pslip\_outside\_fu. Changing the probability for development of a slip outside the follow-up period does not change the results of the model within the range as defined by the literature (a slip may still occur during the follow-up period). (The values on the axes represent the ranges of the variables in the sensitivity analysis.)

**Sensitivity Analysis on  
p\_AVN and p\_chondrolysis and pslip\_outside\_fu**

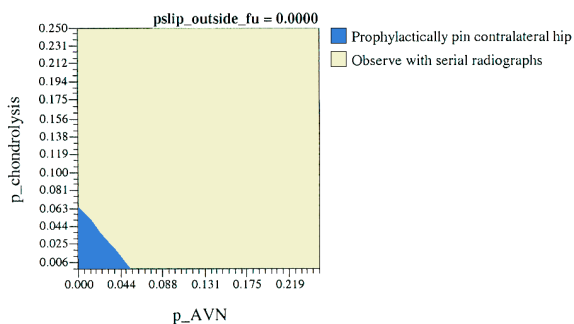

Fig. E-6

**Sensitivity Analysis on  
p\_AVN and p\_chondrolysis and pslip\_outside\_fu**

Fig. E-9

**Sensitivity Analysis on  
p\_AVN and p\_chondrolysis and pslip\_outside\_fu**

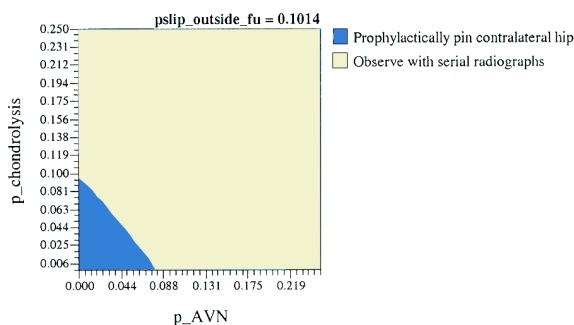

Fig. E-7

**Sensitivity Analysis on  
p\_AVN and p\_chondrolysis and pslip\_outside\_fu**

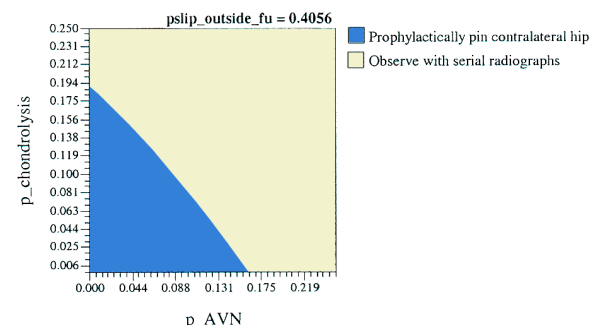

Fig. E-10

**Sensitivity Analysis on  
p\_AVN and p\_chondrolysis and pslip\_outside\_fu**

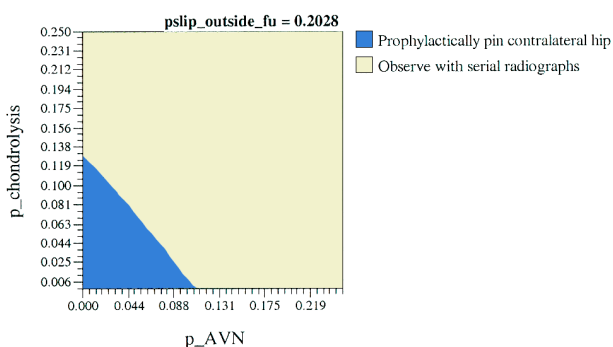

Fig. E-8

**Sensitivity Analysis on  
p\_AVN and p\_chondrolysis and pslip\_outside\_fu**

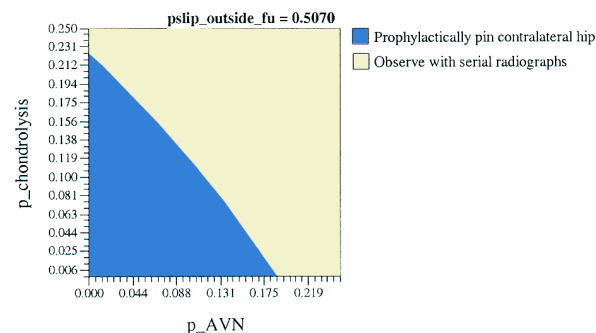

Fig. E-11

Three-way sensitivity analysis on pslip\_outside\_fu, p\_AVN, and p\_chondrolysis. When the values of the three most disputable variables in the model are varied, the results of the model change. The threshold rates at which the model favors prophylactic pinning or radiographic observation are displayed at different values for pslip\_outside\_fu. (The values on the axes represent the ranges of the variables in the sensitivity analysis.)
