The Effect of C-Arm Position on Radiation Exposure During Fixation of Pediatric Supracondylar Fractures of the Humerus http://dx.doi.org/10.2106/JBJS.M.01076

Page 1 of 1

Fig. E-1A

Fig. E-1B

Figs. E-1A and E-1B Photographs during closed reduction and percutaneous pinning of a pediatric supracondylar humeral fracture. In both, the emitter is above the operative elbow and directed down at the image intensifier, which is acting as the operating surface. Fig. E-1A The procedure often requires two surgeons to operate directly next to a vertically oriented C-arm. Fig. E-1B When only one surgeon is available, maximizing the distance from the C-arm is more difficult.
