

Fig. E-1

Quality assessment of included studies. FDRS = full description of reference standard, RIIT = reference standard independent of index test, DSC = description of selection criteria, and ASB = avoids spectrum bias.

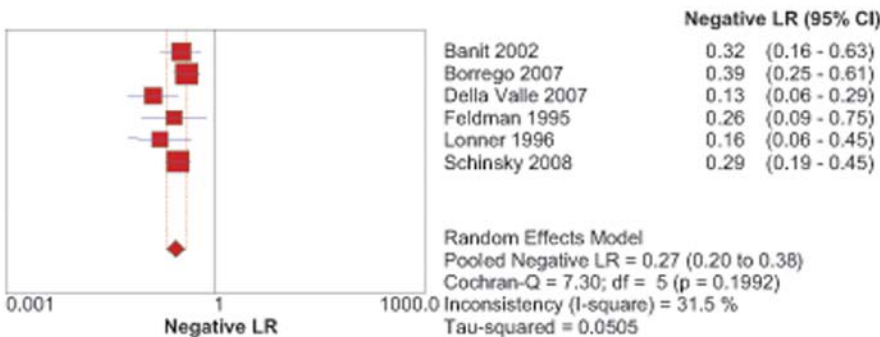

Fig. E-2

Forest plot of the likelihood ratio (LR) of a negative frozen section result using a threshold of 10 polymorphonuclear leukocytes per high-power field for the exclusion of periprosthetic joint infection. CI = confidence interval, and df = degrees of freedom.

Fig. E-3

Forest plot of the likelihood ratio (LR) of a positive frozen section result using a threshold of 10 polymorphonuclear leukocytes per high-power field for the diagnosis of periprosthetic joint infection. CI = confidence interval, and df = degrees of freedom.

Appendix 4: Summary Receiver Operator Characteristic Curve of Frozen Sections compared to Microbiology Culture in the Diagnosis of PJI

Fig. E-4

Summary receiver operating characteristic (SROC) curve of frozen sections compared with microbiologic culture for the diagnosis of periprosthetic joint infection. AUC = area under the curve, SE = standard error, and Q\* = Cochran Q value.

TABLE E-1 Characteristics of the Included Studies\*

| Author, Year      | Study Design† | No. of Patients | No. (%) of PJIs | Frozen Section Threshold Criteria |               |               | PJI Definition |                      | Exclusion Criteria§ |
|-------------------|---------------|-----------------|-----------------|-----------------------------------|---------------|---------------|----------------|----------------------|---------------------|
|                   |               |                 |                 | PMNs                              | No. of Fields | Magnification | Culture        | Additional Criteria‡ |                     |

TABLE E-3 QUADAS Tool Questionnaire\*

|  |
|--|
| 1. Was the spectrum of patients representative of the patients who will receive the test in practice?  |
| 2. Were selection criteria clearly described?  |
| 3. Is the reference standard likely to correctly classify the target condition?  |
| 4. Is the time period between reference standard and index test short enough to be reasonably sure that the target condition did not change between the two tests? |
| 5. Did the whole sample or a random selection of the sample, receive verification using a reference standard of diagnosis?   |
| 6. Did patients receive the same reference standard regardless of the index test result?   |
| 7. Was the reference standard independent of the index test (i.e., the index test did not form part of the reference standard)?                                    |
| 8. Was the execution of the index test described in sufficient detail to permit replication of the test?   |
| 9. Was the execution of the reference standard described in sufficient detail to permit its replication?   |
| 10. Were the index test results interpreted without knowledge of the results of the reference standard?  |
| 11. Were the reference standard results interpreted without knowledge of the results of the index test?  |
| 12. Were the same clinical data available when test results were interpreted as would be available when the test is used in practice?                              |
| 13. Were uninterpretable/intermediate test results reported?   |
| 14. Were withdrawals from the study explained?   |

\*QUADAS = Quality Assessment of Diagnostic Accuracy Studies. Item 1 concerns generalizability. Items 3, 4, 5, 6, 7, 10, 11, and 12 concern validity. Items 2, 8, 9, 13, and 14 concern clarity.

TABLE E-4 Quality Assessment of the Included Studies
