\*According to Criterion A, the histological result was considered to be positive for infection when there were at least five neutrophils per high-power field ( $\times 400$ ) in at least five separate microscopic fields.

†According to Criterion B, the histological result was considered to be positive for infection when there was at least one neutrophil per high power field ( $\times 400$ ), on average, after examination of ten microscopic fields.

‡0 = absent, 1 = moderate, and 2 = severe.
