**Header legend:**

**# shared rels:** # of genes (out of 20 possible) consistently and specifically co-expressed with the target gene that are associated with this entity

**Obs/Exp:** Statistical enrichment ratio - the # of observed commonalities to the # expected by chance alone, given a 20 identically connected genes within a random network of the same size

**Score:** A priority score to rank the relative importance of the commonalities found

**Lit Str:** If the predicted association is also a published association (i.e., apparently correct), Lit Str will be > 0. The higher this #, the more times the two terms are mentioned together in MEDLINE.

blue = Algorithm-predicted relationships that correspond to associations published in MEDLINE

red = associations tested experimentally in this study

Summary: ELTD1 is predicted to be a cell-surface-based factor involved in angiogenesis of neural blood vessels. Only a subset of all predicted associations could be tested in this study. More work needs to be done to confirm the predicted associations given in this table.
