Supplemental Fig.

eFig. 1 Magnetic resonance imaging (MRI) of symptomatic HTRA1 variant carriers.

(A–D) Patient 4 (II-5) at 70 years of age. (E, F) Patient 5 (III-4) at 49 years of age. (G, H) Patient 6 (III-6) at 47 years of age. Fluid-attenuated inversion recovery images (A–C, E–H) showed periventricular to subcortical white matter hyperintensities, lacunar infarctions, and cerebral atrophy. Abnormal intensities were also observed in the external capsule (B, G) and brainstem (C, F, H), but not in the temporal pole (C, F, H).
