

Figure e-3. Impact of DMTs on exosomes and MDM response.

(A& B) Comparative analysis show no significant differences between exosomes derived from DMTs-treated patients and untreated patients for (A) EBV expression and (B) induction of CXCL10. Data represent 6 exosomes from DMTs-treated versus 9 from untreated patients in active disease. (C) Box plots of CXCL10 secretion in MDMs-derived from untreated individuals (10 healthy controls, 6 stable MS, and 6 active patients); after incubation with 45 exosomes for 24 hours. P values are indicated for comparison between exosome groups and for comparison between different responder cell groups. n.s. = non-significant.
