eTable 5. Evolution of EDSS in the NMOSD-AQP4 subgroup according to the number of other accumulated relapse predictors

	T0	T96	p-value ²
	Mean +/- SD	Mean +/- SD	p-value
NMOSD-AQP4+ with no other IRP*	n = 21	n = 21	
EDSS	4.5 +/- 2.5	3.1 +/- 2.6	<0.001
NMOSD-AQP4+ with at least one other IRP*	n = 38	n = 38	
EDSS	5.4 +/- 2.1	5.0 +/- 2.3	0.235

Abbreviations: AQP4+, positive anti-aquaporin-4 antibody; EDSS, Expanded Disability Status Scale; NMOSD, neuromyelitis optica spectrum disorder; T0, initiation of mitoxantrone; T96: at the 96th week of follow-up.

^{*}IRP, identified relapse predictors in multivariate analysis: delay between the first attack and MiTX \geq 24 months, AQP4-IgG seropositivity, and a pretreatment ARR \geq 1.
