Interaction term represents annual change in log hazard difference. Models also control sex, index age group, and calendar year of index date. HR = hazard ratio. CI = confidence interval. SE = standard error. OUD = opioid use disorder. SUD = non-opioid substance use disorder. AUD = alcohol use disorder. SSRI = selective serotonin reuptake inhibitor. SNRI = serotonin-norepinephrine reuptake inhibitor. ADHD = attention-deficit/hyperactivity disorder.

Note. Pain models include patients with painful conditions. Logistic models predict receipt within 1.5 years of index date (patients with at least 2 follow-up years). Youth models include patients aged 14-25 at index. Stricter models define long-term opioids as at least 183 days supply within 6 months. Past-year models include predictors from 12 months prior to index month. All models control sex, index calendar year, and (except youth models) index age group. HR = hazard ratio. OR = odds ratio. CI = confidence interval. OUD = opioid use disorder. SUD = non-opioid substance use disorder. AUD = alcohol use disorder. SSRI = selective serotonin reuptake inhibitor. SNRI = serotonin-norepinephrine reuptake inhibitor. ADHD = attention-deficit/hyperactivity disorder.
