#### 1.1 Risk of bias assessment

Responses <u>underlined in green</u> are potential markers for low risk of bias, and responses in <u>red</u> are potential markers for a risk of bias. Where questions relate only to sign posts to other questions, no formatting is used.

Domain 1: Risk of bias arising from the randomization process

| Signalling questions   | Comments   | Response options |
|--|--|------------------|
| 1.1 Was the allocation sequence random?  1.2 Was the allocation sequence concealed until participants were enrolled and assigned to interventions? | Described as randomisation performed by an independent third party but no information provided about the sequence generation process. Only additional information is that stratified block randomisation is used which almost certainly indicates it is computer randomisation.  No information provided on how allocation sequence was performed. | <u>PY</u><br>NI  |
| 1.3 Did baseline differences between intervention groups suggest a problem with the randomization process?   | Baseline characteristics were relatively well balanced between the 2 groups, the main exceptions being a somewhat higher age and lower pain score in the control group. However, none of the differences between the groups was significant.   | <u>N</u>         |
| Risk-of-bias judgement   |  | Low              |

Domain 2: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)

| Signalling questions                              | Comments   | Response options |
|---|--|------------------|
| 2.1. Were participants aware of their             | Open label trial   | Y                |
| assigned intervention during the trial?           |  |                  |
| 2.2. Were carers and people delivering the        |  | Y                |
| interventions aware of participants'              |  |                  |
| assigned intervention during the trial?           |  |                  |
| 2.3. <u>If Y/PY/NI to 2.1 or 2.2</u> : Were there | No mentions made regarding deviations from the intended intervention | <u>N</u>         |
| deviations from the intended intervention         |  |                  |
| that arose because of the trial context?          |  |                  |
| 2.4 If Y/PY to 2.3: Were these deviations         |  | NA               |
| likely to have affected the outcome?              |  |                  |
| 2.5. If Y/PY/NI to 2.4: Were these                |  | NA               |
| deviations from intended intervention             |  |                  |
| balanced between groups?                          |  |                  |
| 2.6 Was an appropriate analysis used to           | ITT analysis using last observation carried forward for missing data | PY               |
| estimate the effect of assignment to              |  | _                |
| intervention?                                     |  |                  |
| 2.7 If N/PN/NI to 2.6: Was there potential        |  | NA               |
| for a substantial impact (on the result) of       |  |                  |
| the failure to analyse participants in the        |  |                  |
| group to which they were randomized?              |  |                  |
| Risk-of-bias judgement                            |  | Low              |

# Domain 3: Missing outcome data

| Signalling questions  | Comments   | Response options |
|---|--|------------------|
| 3.1 Were data for this outcome available for all, or nearly all, participants randomized?               | No information is provided in the manuscript about extent of missing data. Access to individual patient data from the trial analysis allows to make this judgement. We have access to IPD for all randomised participants, as well as data imputed for participants with missing data so we could replicate the complete case and last observation carried forward analysis. | Y                |
| 3.2 If N/PN/NI to 3.1: Is there evidence that the result was not biased by missing outcome data?        |  | NA               |
| 3.3 <u>If N/PN to 3.2</u> : Could missingness in the outcome depend on its true value?                  |  | NA               |
| 3.4 <u>If Y/PY/NI to 3.3</u> : Is it likely that missingness in the outcome depended on its true value? |  | NA               |
| Risk-of-bias judgement  |  | Low              |

### Domain 4: Risk of bias in measurement of the outcome

| Signalling questions   | Comments  | Response options |
|--|---|------------------|
| 4.1 Was the method of measuring the outcome inappropriate?   | The methods to measure the outcomes were appropriate.   | <u>N</u>         |
| 4.2 Could measurement or ascertainment of the outcome have differed between intervention groups?                         |   | N                |
| 4.3 If N/PN/NI to 4.1 and 4.2: Were outcome assessors aware of the intervention received by study participants?          | Open label trial. Study author mentioned the outcome assessors were aware of the treatments being received by participants.   | Y                |
| 4.4 If Y/PY/NI to 4.3: Could assessment of the outcome have been influenced by knowledge of intervention received?       | Assessment of pain is subjective and therefore knowledge of treatment being received could influence outcome assessment.  It is plausible that knowledge and beliefs of beneficial effect from the intervention | PY               |
| 4.5 If Y/PY/NI to 4.4: Is it likely that assessment of the outcome was influenced by knowledge of intervention received? | could have influenced the outcomes.   | PY               |
| Risk-of-bias judgement   |   | High             |

# Domain 5: Risk of bias in selection of the reported result

| Signalling questions   | Comments   | Response options |
|--|--|------------------|
| 5.1 Were the data that produced this result<br>analysed in accordance with a pre-<br>specified analysis plan that was finalized<br>before unblinded outcome data were<br>available for analysis? | Unclear if a pre-specified analysis plan was finalised before data were available for analysis.        | NI               |
| Is the numerical result being assessed likely to have been selected, on the basis of the results, from   |  |                  |
| 5.2 multiple eligible outcome measurements (e.g. scales, definitions, time points) within the outcome domain?  | All eligible reported results for the outcome domains correspond to all intended outcome measurements. | <u>N</u>         |
| 5.3 multiple eligible analyses of the data?  |  | N                |
| Risk-of-bias judgement   |  | Some concerns    |

### Overall risk of bias

| Risk-of-bias judgement | High |

#### 1.2 Risk of bias assessment

Responses <u>underlined in green</u> are potential markers for low risk of bias, and responses in <u>red</u> are potential markers for a risk of bias. Where questions relate only to sign posts to other questions, no formatting is used.

Domain 1: Risk of bias arising from the randomization process

| Signalling questions   | Comments   | Response options |
|--|--|------------------|
| 1.1 Was the allocation sequence random?  | Described as computerised randomisation.                                     | <u>Y</u>         |
|  | No information provided on how allocation sequence was performed.            |                  |
| 1.2 Was the allocation sequence concealed until participants were enrolled and assigned to interventions?  |  | NI               |
| 1.3 Did baseline differences between intervention groups suggest a problem with the randomization process? | Baseline characteristics were relatively well balanced between the 2 groups. | <u>N</u>         |
| Risk-of-bias judgement   |  | Low              |

Domain 2: Risk of bias due to deviations from the intended interventions (effect of assignment to intervention)

| Signalling questions                              | Comments   | Response options |
|---|--|------------------|
| 2.1. Were participants aware of their             | Open label trial   | Y                |
| assigned intervention during the trial?           |  |                  |
| 2.2. Were carers and people delivering the        |  | Y                |
| interventions aware of participants'              |  |                  |
| assigned intervention during the trial?           |  |                  |
| 2.3. <u>If Y/PY/NI to 2.1 or 2.2</u> : Were there | No mentions made regarding deviations from the intended intervention | <u>N</u>         |
| deviations from the intended intervention         |  |                  |
| that arose because of the trial context?          |  |                  |
| 2.4 If Y/PY to 2.3: Were these deviations         |  | NA               |
| likely to have affected the outcome?              |  |                  |
| 2.5. If Y/PY/NI to 2.4: Were these                |  | NA               |
| deviations from intended intervention             |  |                  |
| balanced between groups?                          |  |                  |
| 2.6 Was an appropriate analysis used to           | ITT analysis.  | Y                |
| estimate the effect of assignment to              |  |                  |
| intervention?                                     |  |                  |
| 2.7 If N/PN/NI to 2.6: Was there potential        |  | NA               |
| for a substantial impact (on the result) of       |  |                  |
| the failure to analyse participants in the        |  |                  |
| group to which they were randomized?              |  |                  |
| Risk-of-bias judgement                            |  | Low              |

# Domain 3: Missing outcome data

| Signalling questions  | Comments  | Response options |
|---|---|------------------|
| 3.1 Were data for this outcome available for all, or nearly all, participants randomized?               | Outcome data were available for 19 patients (86.4%) in the SCS group and 14 patients in the BMT group (100%) at 6 months. | Y                |
| 3.2 If N/PN/NI to 3.1: Is there evidence that the result was not biased by missing outcome data?        |   | NA               |
| 3.3 <u>If N/PN to 3.2</u> : Could missingness in the outcome depend on its true value?                  |   | NA               |
| 3.4 <u>If Y/PY/NI to 3.3</u> : Is it likely that missingness in the outcome depended on its true value? |   | NA               |
| Risk-of-bias judgement  |   | Low              |

# Domain 4: Risk of bias in measurement of the outcome

| Signalling questions   | Comments  | Response options |
|--|---|------------------|
| 4.1 Was the method of measuring the outcome inappropriate?   | The methods to measure the outcomes were appropriate.   | N                |
| 4.2 Could measurement or ascertainment of the outcome have differed between intervention groups?                           |   | N                |
| 4.3 If N/PN/NI to 4.1 and 4.2: Were outcome assessors aware of the intervention received by study participants?            | Open label trial. Study author mentioned the outcome assessors were aware of the treatments being received by participants.   | Y                |
| 4.4 <u>If Y/PY/NI to 4.3</u> : Could assessment of the outcome have been influenced by knowledge of intervention received? | Assessment of pain is subjective and therefore knowledge of treatment being received could influence outcome assessment.  It is plausible that knowledge and beliefs of beneficial effect from the intervention | PY               |
| 4.5 If Y/PY/NI to 4.4: Is it likely that assessment of the outcome was influenced by knowledge of intervention received?   | could have influenced the outcomes.   | PY               |
| Risk-of-bias judgement   |   | High             |

# Domain 5: Risk of bias in selection of the reported result

| Signalling questions   | Comments   | Response options |
|--|--|------------------|
| 5.1 Were the data that produced this result<br>analysed in accordance with a pre-<br>specified analysis plan that was finalized<br>before unblinded outcome data were<br>available for analysis? | Unclear if a pre-specified analysis plan was finalised before data were available for analysis.        | NI               |
| Is the numerical result being assessed likely to have been selected, on the basis of the results, from   |  |                  |
| 5.2 multiple eligible outcome measurements (e.g. scales, definitions, time points) within the outcome domain?  | All eligible reported results for the outcome domains correspond to all intended outcome measurements. | <u>N</u>         |
| 5.3 multiple eligible analyses of the data?  |  | N                |
| Risk-of-bias judgement   |  | Some concerns    |

### Overall risk of bias

| Risk-of-bias judgement | High |
|------------------------|------|
|                        |      |
|                        |      |
|                        |      |
|                        |      |
