

Supplemental Figure 1. Pain thresholds, calculated from the pain-rating curve data, similar to a method of constant stimuli threshold, were different by diagnostic group, with the ASD group reporting lower thresholds ($\text{Mean}_{\text{ASD}} = 42.463 \pm 2.723^{\circ}\text{C}$) compared to the typical group ($\text{Mean}_{\text{TD}} = 44.956 \pm 2.386^{\circ}\text{C}$, $w = 258$, $p = 0.007$).
