

Supplemental Digital Content 1, Figure S1. Plasma and CSF levels of sCD14, CCL2, and IL-6 are higher in HIV+ subjects than in uninfected healthy controls. Plasma and CSF sCD14, CCL2, and IL-6 levels were compared between cohort subjects (n=67) and healthy controls (n=34). HIV+ subjects had higher plasma and CSF levels of sCD14, CCL2, and IL-6 compared to healthy controls. Median values are indicated as horizontal lines. Statistical significance between groups was calculated using the Mann-Whitney test; significant differences ($p < 0.05$) are indicated.
