

Figure, Supplemental Digital Content 3: Clinical Outcomes in Sepsis Patients With and Without Immunoparalysis

The proportion of sepsis patients with hospital-acquired infection (HAI), complicated course, and mortality at 28 days by presence or absence of immunoparalysis defined by *ex vivo* lipopolysaccharide-stimulated whole blood TNF- α ≤ 200 pg/mL on study day 1-2 (A), day 3-5 (B), and day 8-14 (C) or immunoparalysis defined by monocyte HLA-DR $\leq 30\%$ on study day 1-2 (D), 3-5 (E), and 8-4 (F). * $p < 0.05$ after Bonferroni correction for multiple comparisons
