Microbiological PCR diagnosis

P. jirovecii DNA was detected in induced sputum and/or BAL specimens using an ‘in-house’ real-time PCR assay adapted from Brancart (31). The *P. jirovecii* β-tubulin gene was amplified using primers 1186F (5'-GATCCGAGACATGGTCGCTATT) and 1257R (5'-TTCAACCTCCTCATGGAAACAG), and TaqMan 1212T probe (5'-6FAM-TGTTGCAGCGATTTCGCGGTA-BHQ1). DNA was extracted from samples using NucliSENS® easyMAG® (bioMérieux, Castle Hill, NSW, Australia) according to manufacturer’s instructions. Each 20µL - PCR reaction contained 1xLC FastStart reaction mix (containing FastStart *Taq* DNA polymerase, reaction buffer, dNTPs and 1mM MgCl₂), 3.5mM MgCl₂, 0.5µM 1186F and 1257R primers, 0.05µM 1212T probe and 10µl DNA. Cycling parameters were 95°C for 10 min, followed by 40 cycles 95°C for 5s, 58°C for 20s and 72°C for 20s. Samples with a crossing value <37.3 cycles were classified “positive” for *P. jirovecii*.
