

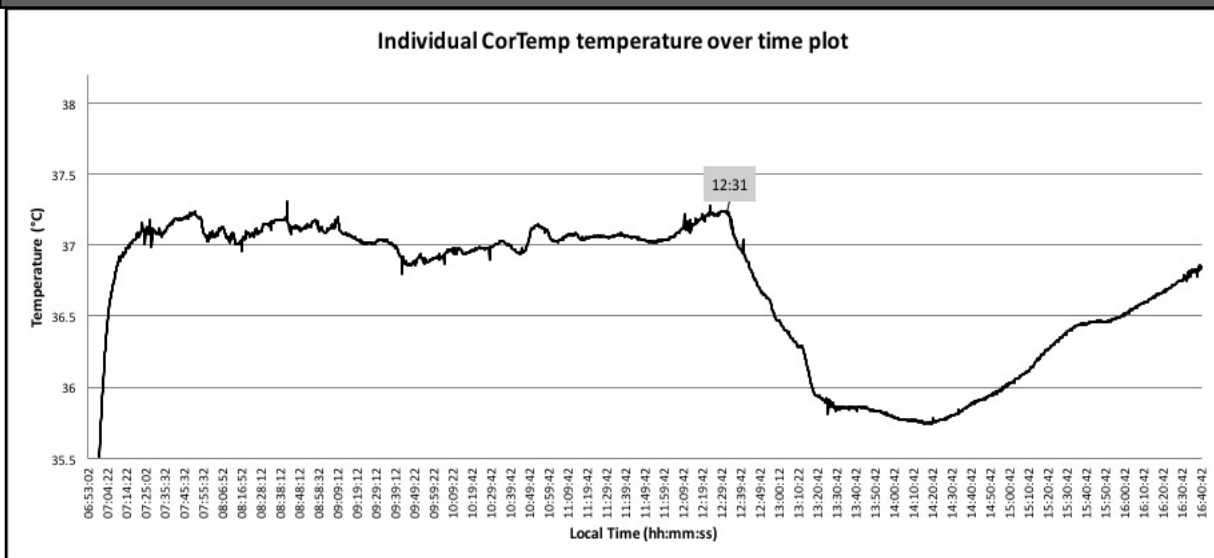

Figure S6: The individual CorTemp data plot for participant number twenty-seven. The figure reports the data of participant twenty-seven who was excluded from statistical analysis.

**Figure S6: The individual CorTemp plot for participant number twenty-seven**

This data was not included in statistical analysis.

Spinal anesthetic injection for participant number twenty-seven is labelled on the plot at 12:31. The participant developed an asymmetrical neuraxial block insufficient for cesarean delivery. The case was converted to general anesthetic and continued uneventful. Her neuraxial block remained asymmetrical after recovery from the general anesthetic. She had full neuraxial recovery within 8 hours of spinal anesthetic injection. Inspection of the CorTemp data revealed decrease in intestinal temperature prior to induction of general anesthetic.
