Process

Import original spreadsheet of feedback data, which included demographics, comments, and raters' scores for the attributes.

Removes columns that we are not interested in for the creation of a predictive model (ex: institution ID, evaluator ID, Date).

Designates which column we are interested in predicting, denoting its target role as "Label."

Transforms the dummy coded "0 / 1" numerical values of the column of interest into binominal values "false / true" which are more appropriate for classification.

Sets the Comments column to be read as text strings for text processing, instead of as a polynomial value.

Subprocess to perform text processing of comments. (detailed in another figure).
