## Supplemental Digital Content 6. Exposures to anesthesia after age 3

<sup>1</sup>Kruskal Wallis

<sup>2</sup>Chi-Square

<sup>3</sup>Includes exposures to general anesthesia prior to date of testing at Mayo Clinic only. Thus, these data represent the lower bound of potential exposures, as it is possible that children may have had additional exposure at other facilities. For the 1052 anesthetic exposures prior to age 3, 89% occurred at Mayo Clinic.
