Also included are analyses planned *a priori* for those variables with an available clinical cut-off score indicating an abnormality (< 85 for the WASI full scale IQ and >60 for the BRIEF and CBCL). These results are reported as log-odds ratio (so that 0 represents no effect and the results match the scale of other outcomes). Exponentiating produces the odds ratio (such that odds ratio = 1 is no effect, because $\exp(0)=1$).

* 2 degrees of freedom test for overall difference, significance indicated in bold for $p < 0.05$

** Pairwise comparisons of single or multiple exposures versus no exposure, significance indicated in bold for $p < 0.025$ (Bonferroni adjustment).

***Note that the significant difference noted for the 2 degrees of freedom test reflects the opposite signs and similar absolute values for single and multiple exposure effect size estimates.

†Estimate for unexposed children (95% CI)

††In addition to scores derived from the test developers, 4 study-specific composite scores were defined *a priori* from individual tests to increase the ability to detect effects when more than one instrument assessed a particular domain. Individual test scores were first converted to standard-scores using available normative data from either the test developers or available scientific literature. The individual standard-scores were then averaged to create an overall composite domain score.

‡Because normative data was not available for the Judgement of Line Orientation for older subjects, standard scores could not be calculated and these older children are excluded from this analysis. In addition, normative data was also not available for the Boston Naming Test for subjects aged 19 or 20, who were excluded from analysis.

‡‡The WRAML-2 Design Memory task requires drawing figures by pencil, thus motor coordination.

‡‡‡8%, 10%, and 15% of the unexposed, singly-exposed, and multiply-exposed children were left handed, respectively ($p=0.029$, Pearson Chi-squared)

N indicated number of children completing a given test. TS, T score (mean = 50, standard deviation = 10); SS, Scaled score (mean = 10, standard deviation = 3); StdS, Standard score (mean = 100, standard deviation = 15); ZS, Z score (mean = 0, standard deviation = 1). D-KEFS, Delis-Kaplan Executive Function System; WASI, Wechsler Abbreviated Scale of Intelligence; WRAML-2, Wide Range Assessment of Memory and Learning- Second Edition; CPT II, Connor's Continuous Performance Test II; CTOPP, Comprehensive Test of Phonological Processing; ADHD, attention deficit hyperactivity disorder; BRIEF, Behavior Rating Inventory of Executive Function; CLDQ, Colorado Learning Difficulties Questionnaire; CBCL, Child Behavior Checklist.
