Supplemental Figure 1. Percent change in eGFR by study group

Supplemental Table 1. SF-36 scores, by study group

Supplemental Table 2. Abdominal symptom severity scores, by study group

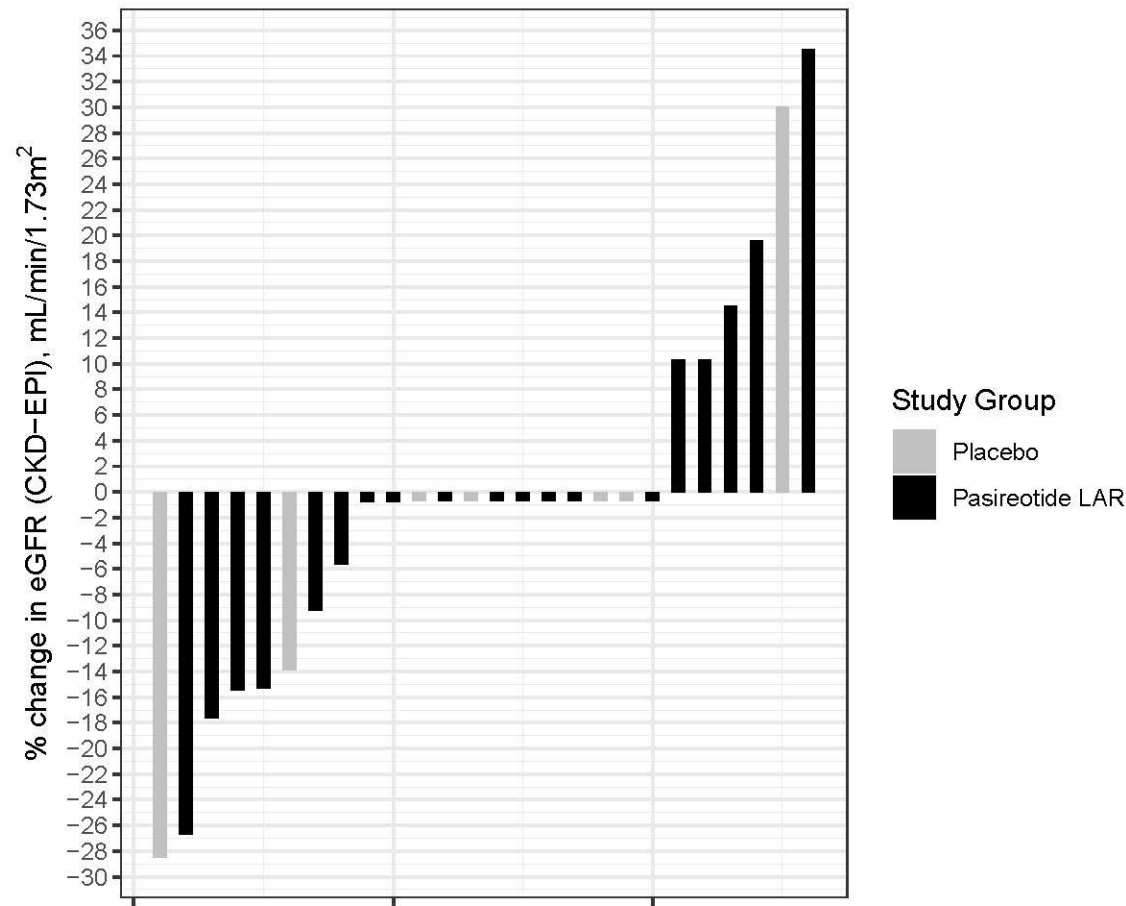

## Supplementary Methods

TLV and TKV measures were first divided by height in meters in order to get height-adjusted volumes. Then, annualized percent change was calculated using the following formula: height-adjusted volume at 12 months – height adjusted volume at baseline divided by height adjusted volume at baseline, multiplied by 100. Since this is a relative measure, height is canceled out; however, when measured as absolute change, height is not canceled out, and thus adjusted for in the analysis. Analyses were performed with SAS version 9.3 software (SAS Institute Inc.), R 3.4.2 (1) and the ggplot2 package (2).

| Standardized mental component scale   | 55 ± 7                 | 55 ± 7.0 | -0.0 ± 6.2                        | 0.98                   | 49 ± 10       | 50 ± 8  | 0.3 ± 10                          | 0.92                   | 0.91  |

Data are mean ± SD. Scored on a range of 0 to 100 (0=worst imaginable, 100=best imaginable)

P-values within treatment groups were calculated to assess the difference in subscale scores in patients between baseline and 12 months, and were assessed using paired t-tests. P-values between treatment groups were calculated to assess the difference in change from baseline to 12 months between treatment groups, and were assessed using the equal variance t-test.

There were 28 patients (n=19 pasireotide LAR and n=9 Placebo) who completed both their baseline and 1 year follow-up SF-36 survey.

P-values in bold denote significance at the 0.05 alpha level.

<sup>a</sup>Change from baseline=X mo value–baseline value

**Supplemental Table 2. Abdominal symptom severity scores, by study group**

| Measure                                 | Pasireotide LAR (n=20) |             |              | Placebo (n=9) |             |       |

| <b>VAS pain score</b>                   | 24.2 ± 27.3            | 23.8 ± 23.6 | 0.96         | 40.3 ± 24.9   | 34.8 ± 21.0 | 0.41  |

Data are mean ± SD for continuous measures and n/total (%) for categorical measures. Abdominal symptom severity ≥2 on a 7-point adjectival scale ranging from 0-6.

Bovenschen HJ et al. Evaluation of a gastrointestinal symptoms questionnaire. Dig Dis Sci 2006; 51:1509–15.

VAS scored on a range of 0 to 100 (0=no pain, -100=worst pain).P (McNemar's test for categorical variables; Paired t-test for continuous variables).

P-values in bold denote significance at the 0.05 alpha level.

There were 29 patients (n=20 pasireotide LAR and n=9 Placebo) who filled out both their baseline and 1 year follow-up abdominal symptoms survey.

P-values with blank cells were not estimable.
