**Supplemental Figure 1: Calibration plots of risk model**

The diagonal line represents perfect calibration. Calibration of the bleeding risk score is relatively good up to a predicted rate of major bleeding of approximately 30% (i.e. in 50,234/52,138 (96%) of patients). Vertical bars represent 95% CIs.

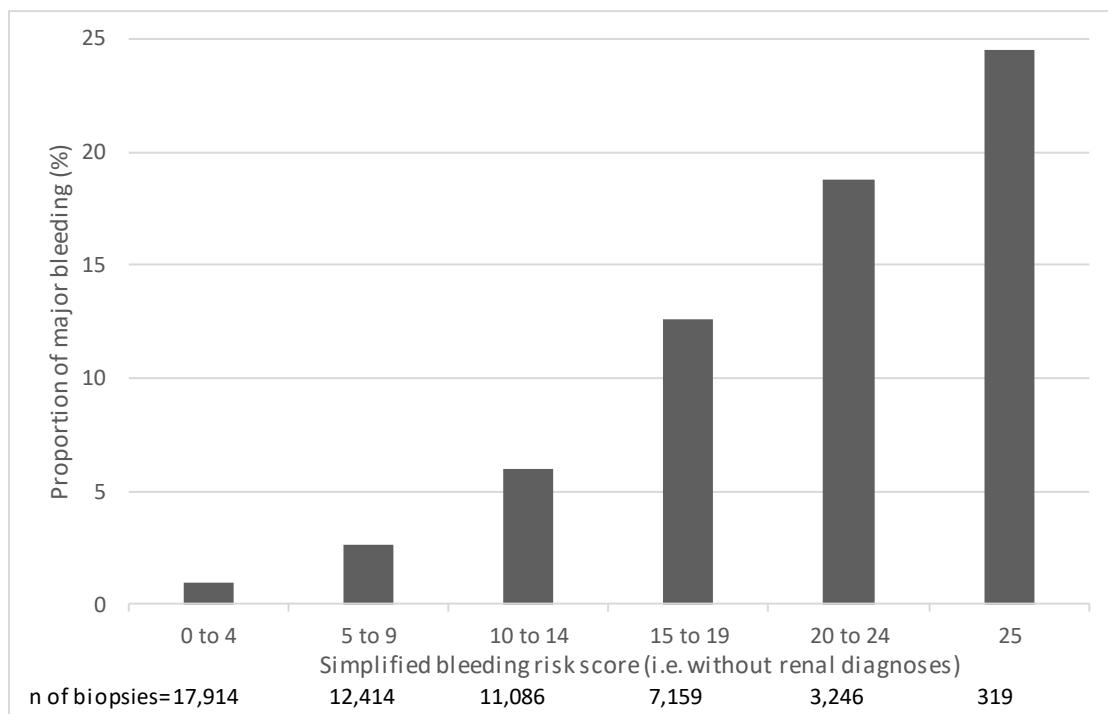

## Supplemental Figure 2: Major Bleeding Risk

ROC curves in patients according to the number of biopsies per year (4 quartiles : 1 = first quartile, 2 = second quartile, 3 = third quartile ; 4 = fourth quartile). AUC ROC differences among curves were significant ( $p=0.001$ ) but not clinically relevant.

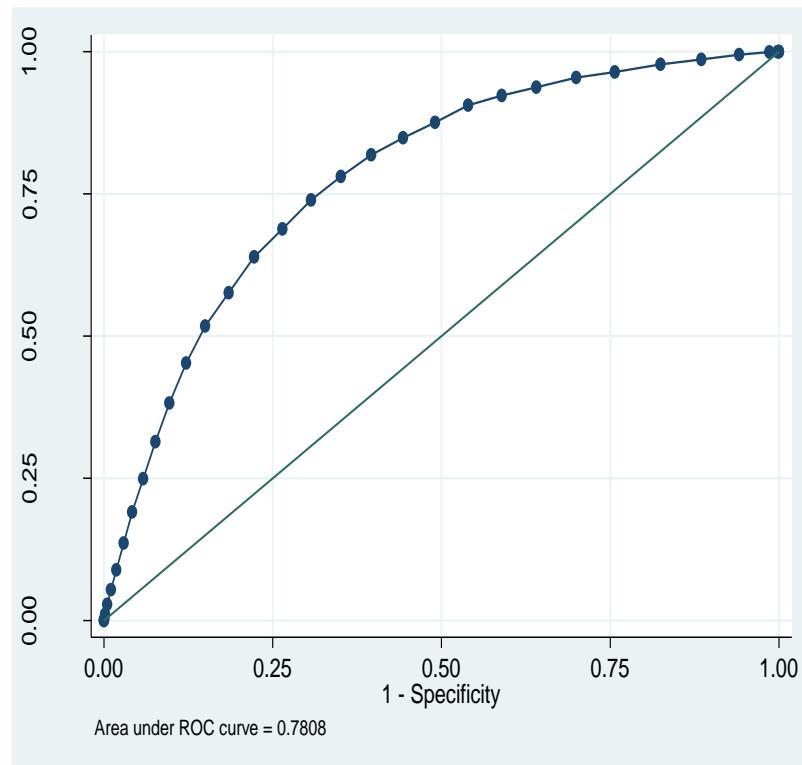

Supplemental Figure 3a : Proportion of Major Bleeding According to Simplified Risk Score

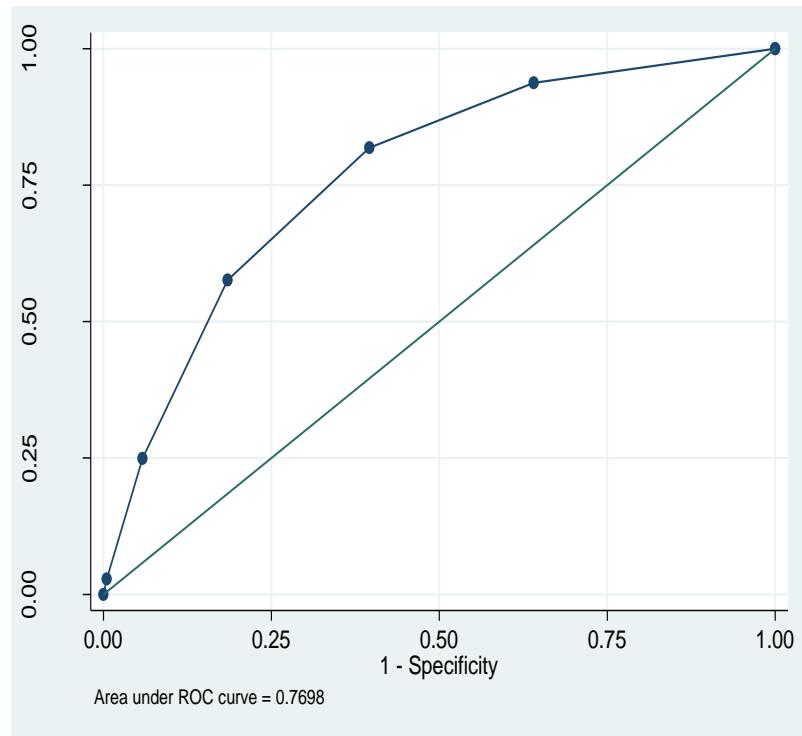

**Simplified major bleeding score** = (age (45-60 : +1 point, 61-71 : +2 points ; >71 : +3 points) + Charlson index (2-4 : +2 points, 5-6 : +4 points, >6 : +6 points) + frailty index (1.5-4.4 : +2 points, 4.5-9.5 : +4 points, >9.5 : +6 points) + gender (male : -1 point) + diabetes mellitus (-1 point) + dyslipidemia (-1 point) + hypertension (-1 point) + obesity (-1 point) + abnormal kidney function (+2 points) + anemia (+5 points) + thrombocytopenia (+2 points) + cancer (+2 points) + acute kidney injury (+3 points)) + 5 points.
