

Appendix 1: Lasagna Plots Can Be Made in Different (Statistical) Ovens

This appendix serves as an online supplement to “Lasagna Plots Can Be Made in Different (Statistical) Ovens.” We provide SAS code snippets and figures of examples used in the commentary by Dr. Swihart and his colleagues in *Epidemiology*.¹

The logic that SAS uses to produce a lasagna plot is pretty straightforward. SAS regards a lasagna plot as a non-geographic map: a grid should be created as a “map”; the values of repeated measures for each subject, as represented by colors, will be filled in each corresponding unit on the grid; the labels and reference lines can be added in the last step by annotations.

SAS code to duplicate Figure 1 in the commentary¹

*This is the SAS code to duplicate Figure 1 in Dr. Swihart's commentary;

```
*Step 0: create some macro variables for generalizability;
*get the name of the input data;
%let data=lasagnal;
*get the variable name of the patient ID variable;
%let ptid=ptid;
*get number of visit and the variable name of each visit;
%let number_visit=6;
%let visit1=visit1;
%let visit2=visit2;
%let visit3=visit3;
%let visit4=visit4;
%let visit5=visit5;
%let visit6=visit6;
*get number of subjects;
proc sql;
  select count(unique &ptid.) into: subject_number
    from &data.;
quit;
*this macro will be used to transform a wide dataset into a long
dataset;
%macro transpose (input, output);
%do i=1 %to &number_visit.;
  data temp&i.;
    length matchid $20.;
    set &input.;
    keep &ptid. outcome matchid time;
    matchid=left(cat(put(temp, 10.), "&i."));
    outcome=&&visit&i.;
    time=&i.;
  run;
  proc append base=&output data= temp&i.;
  run;
  proc datasets library=work;
    delete temp&i.;
  run;quit;
%end;
%mend;
```

Three steps to prepare three datasets for lasagna plots.

Step 1: prepare for a grid dataset.

```
data grid_dataset;
  length matchid $ 20;
  do grid_y = 0 to &subject_number. ;
    do grid_x = 0 to &number_visit. ;
      matchid=trim(left(put(grid_y,best.)))||'_'||trim(left(put(grid_x,
best.))));
      x=grid_x*(100/&number_visit.)-(100/&number_visit.);
      y=grid_y*(125/&subject_number.)-(125/&subject_number.);
    output;
      x=x+(100/&number_visit.); output;
      y=y+(125/&subject_number.); output;
      x=x-(100/&number_visit.); output;
    end;
  end;
run;
```

Step 2: prepare for response datasets in specific sorting and/or clustering.

```
*the order of subjects in Figure 1 is based on the order of subject id;
*descending sort of ID b/c graphing from bottom to top;
proc sort data=&data. out=lasagna;
  by descending &ptid. ;
run;

*transpose the dataset from a wide dataset into a long dataset and
assign matchid so that later can match to the grid;
data lasagna;
  set lasagna;
  temp=_n_;
run;

%transpose(lasagna,response_data1);
```

Step 3: prepare for annotation data sets.

```
*annotation dataset for Figure 1;
data annol;
input @1 y 3.      @5 x 3.      @9 rotate 3. @13 angle 2. @16 function
$5. @22 text $7. ;
  xsys="2";
  ysys="2";
  when="a";
  style="'Albany AMT'";
  position='4';
  color='black';
  size=1;
cards;
70 -5      360 90 Label Subject
-4 50 0 0 Label Time
0 0 0 0 Move
0 100 0 0 Draw
125 0 0 0 Move
125 100 0 0 Draw
0 0 0 0 Move
125 0 0 0 Draw
0 100 0 0 Move
```

```

125 100 0    0  Draw
;run;

Step 4: Combine three datasets with the GMAP procedure:
filename lasagna 'H:\Lasagna\lasagna_Figure1.gif';
goptions reset=all dev=JPEG300 gsfname=lasagna   xpixels=400
ypixels=550 ftext='Swiss' htext=0.8;

pattern1 v=s c=CX993404;
pattern2 v=s c=CXD95F0E;
pattern3 v=s c=CXFE9929;
pattern4 v=s c=CXFEC44F;
pattern5 v=s c=CXFEE391;
pattern6 v=s c=CXFFFFD4;

proc gmap data=response_data1 map=grid_dataset all;
  id matchid;
  choro outcome/ nolegend coutline=white anno=anno1 discrete;
run;quit;

```

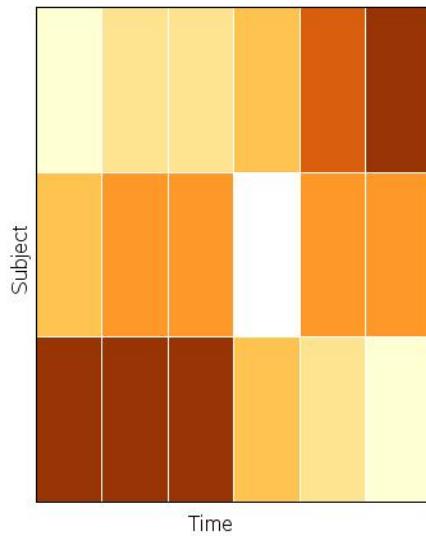

Figure 1 in the commentary¹ duplicated from SAS code

SAS code to duplicate Figure 2 in the commentary¹

*This is the SAS code to duplicate Figure 2 in Dr. Swihart's commentary;

```
*Step 0: create some macro variables for generalizability;
*get the name of the input data;
%let data=lasagna2;
*get the variable name of the patient ID variable;
%let ptid=ptid;
*get number of visit and the variable name of each visit;
%let number_visit=6;
%let visit1=visit1;
%let visit2=visit2;
%let visit3=visit3;
%let visit4=visit4;
%let visit5=visit5;
%let visit6=visit6;
*get number of subjects;
proc sql;
    select count(unique &ptid.) into: subject_number
    from &data.;
quit;
*this macro will be used to transform a wide dataset into a long
dataset;
%macro transpose (input, output);
%do i=1 %to &number_visit.;
    data temp&i.;
        length matchid $20.;
        set &input.;
        keep &ptid. outcome matchid;
        matchid=left(cat(put(temp, 10.), "&i."));
        outcome=&&visit&i.;
    run;
    proc append base=&output data= temp&i.;
    run;
    proc datasets library=work;
        delete temp&i.;
    run;quit;
%end;
%mend;
```

Three steps to prepare three datasets for lasagna plots.

Step 1: prepare for a grid dataset.

```
data grid_dataset;
    length matchid $ 20;
    do grid_y = 0 to &subject_number. ;
        do grid_x = 0 to &number_visit.;

            matchid=trim(left(put(grid_y,best.)))||'|'||trim(left(put(grid_x,
best.)));
            x=grid_x*(100/&number_visit.)-(100/&number_visit.);
            y=grid_y*(50/&subject_number.)-(50/&subject_number.);
        output;
        x=x+(100/&number_visit.); output;
        y=y+(50/&subject_number.); output;
        x=x-(100/&number_visit.); output;
```

```

        end;
    end;
run;

Step 2: prepare for response datasets in specific sorting and/or clustering.

*response dataset for Figure 2A;
*the order of subjects in Figure 2A is based on the order of subject
id;*descending sort of ID b/c graphing from bottom to top;
proc sort data=&data. out=lasagna;
    by descending &ptid.;
run;

*transpose the dataset from a wide dataset into a long dataset and
assign matchid so that later can match to the grid;
data lasagna;
    set lasagna;
    temp=_n_;
run;
%transpose (lasagna, response_data2A);

*response dataset for Figure 2B;
*sort within each row based on value;
%macro sort_within_row;
%do i=1 %to &subject_number.;
    data ptid&i.;
        set &data.;
        where &ptid=&i.;
    run;
    proc transpose data=ptid&i. out=ptid&i.t prefix=_&i ;
    run;
    data ptid&i.t;
        set ptid&i.t;
        if _name_="ptid" or _name_="temp" then delete;
        drop _name_;
    run;
    proc sort data=ptid&i.t;
        by _&i.1;
    run;
    proc transpose data=ptid&i.t out=ptid&i.t2 prefix=visit;
    run;
    proc append base=lasagna data=ptid&i.t2;
    run;
    proc datasets library=work;
        delete ptid&i. ptid&i.t ptid&i.t2;
    run;quit;
%end;
%mend;
%sort_within_row;

*the order of subjects in Figure 2B is based on the order of subject
id;*descending sort of ID b/c graphing from bottom to top;
proc sort data= lasagna;
    by descending _name_;
run;

```

```

*t transpose the dataset from a wide dataset into a long dataset and
assign matchid so that later can match to the grid;
data lasagna;
    set lasagna;
    temp=_n_;
run;
%transpose (lasagna, response_data2B);

*response dataset for Figure 2C;
*re order the subjects;
data lasagna;
    set &data.;
    if label="T1" then group=1;
    else if label="T2" then group=1;
    else if label="P1" then group=2;
    else if label="P2" then group=2;
run;
proc sort data=lasagna;
by descending group descending label;
run;

*t transpose the dataset from a wide dataset into a long dataset and
assign matchid so that later can match to the grid;
data lasagna;
    set lasagna;
    temp=_n_;
run;

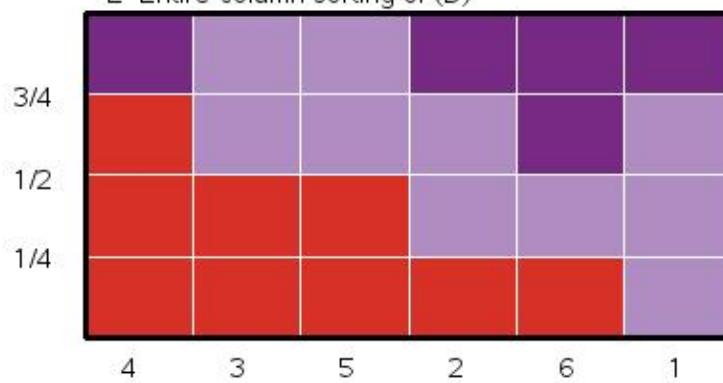

Figure 2 in the commentary¹ duplicated from SAS code

SAS code to duplicate Figure 3 in the commentary¹

*This is the SAS code to duplicate Figure 3 in Dr. Swihart's commentary;
*Since I do not have the exact data, the code only shows the method of clustering and sorting;

```
*Step 0: create some macro variables for generalizability;
*get the name of the input data;
%let data=lasagna3;
*get the name of cluster variable;
%let cluster=cluster;
*get the variable name of the patient ID variable;
%let ptid=ptid;
*get number of visit we are going to plot and the variable name of each visit;
%let number_visit=4;
%let visit1=visit1;
%let visit2=visit2;
%let visit3=visit3;
%let visit4=visit4;
*get number of subjects;
proc sql;
    select count(unique &ptid.) into: subject_number
    from &data.;
quit;
*this macro will be used to transform a wide dataset into a long dataset;
%macro transpose (input, output);
%do i=1 %to &number_visit.;
    data temp&i.;
        length matchid $20.;
        set &input.;
        keep &ptid. visit matchid time;
        matchid=left(cat(put(temp, 10.), "_&i."));
        visit=&&visit&i.;
        time=&i.;
    run;
    proc append base=&output data=temp&i.;
    run;
    proc datasets library=work;
        delete temp&i.;
    run;quit;
%end;
%mend;
```

Three steps to prepare three datasets for lasagna plots.

Step 1: prepare for a grid dataset.

```
data grid_dataset;
    length matchid $ 20;
    do grid_y = 0 to &subject_number. ;
        do grid_x = 0 to &number_visit.;

            matchid=trim(left(put(grid_y,best.)))||'_|'||trim(left(put(grid_x,
best.)));
            x=grid_x*(100/&number_visit.)-(100/&number_visit.);
```

```

        y=grid_y*(100/&subject_number.)-(100/&subject_number.);
output;
x=x+(100/&number_visit.); output;
y=y+(100/&subject_number.); output;
x=x-(100/&number_visit.); output;
end;
end;
run;

```

Step 2: prepare for response datasets in specific sorting and/or clustering.

```

* sort the data first by cluster than by value of each visit;
proc sort data=&data. out=lasagna;
  by &cluster &visit1 &visit2 &visit3 &visit4 ;
run;

data lasagna;
  set lasagna;
  temp=_n_;
run;
%transpose(lasagna, response_data3);

*categorize the values of each visit into five categories to match five
colors;
data response_data3;
  set response_data3;
  if visit=. then visitC=.;
  else if visit lt 30 then visitC=1;
  else if visit lt 60 then visitC=2;
  else if visit lt 90 then visitC=3;
  else if visit lt 120 then visitC=4;
  else visitC=5;
run;

```

Step 3: prepare for annotation data sets.

```

*annotation dataset for Figure 3;
data anno;
