

Figure 1 - Case 1: Cervical prevertebral edema in T1w (A) and T2w (B) sagittal MRI sequences with low T1w signal intensity within the marrow of the clivus representing edema (white arrows) and a small fluid collection at the caudal aspect of the clivus consistent with a subperiosteal abscess (red arrows). Nuclear imaging with a bone scan (C, D) and SPECT-CT (E, F) shows abnormally increased tracer uptake within the clivus centered on the growth plate.
