

**Figure 2** - Case 2: A contrast enhanced MRI showing a focal lesion within the clivus with peripheral rim enhancement and central low signal on T1w with gadolinium (A) and high intensity on T2w sagittal image (B). The central region demonstrates restricted diffusion on the diffusion weighted sequences - b1000 (C) and ADC (D) images (white arrows). A CT scan (E) shows focal erosion of the cortex of the clivus anteriorly (white circle).
