## **INTRODUCTION**

The following pages contain descriptions of the movement system problems we have identified among people with neuromuscular conditions. While many of the people in the categories described in this set of diagnoses may have a central nervous system pathology, many will have non-specific and/or varied health conditions. What the patients have in common is one or more limitations in their ability to move within the environment, manipulate objects, and /or balance in a given position for reasons other than pain. In this set of movement impairment diagnoses, rather than being sorted by traditional health conditions or diseases, patients are categorized by their type of movement system problem. This allows for the grouping of patients along parameters that physical therapists both examine and treat.

We believe that the movement system problems described apply to both the adult and pediatric population. There are differences between adults and children in the health conditions associated with a given movement impairment diagnosis and the tasks examined. We have used the following symbols to designate characteristics of the diagnosis applicable for all age groups and those associated predominantly with pediatrics:

- KEY**
- Observed in all age groups
  - Ⓢ Observed in pediatrics

We have described the clinical examination required to identify these movement system diagnoses in an accompanying document. The examination consists of tests of body structures and functions and observational analysis of specific tasks. The key findings that relate to each specific diagnosis are outlined in the pages that follow.

In addition to the examination, we have outlined sample treatments for each of the diagnoses. The treatment ideas are derived from external evidence where possible and clinical practice experience. Because much of the literature related to rehabilitation intervention is sorted by health condition rather than movement system problem, the supporting external evidence for our treatment ideas is based on our understanding of the subjects in a given study, the study results, and how they may be related to the movement system problem described.

To request a copy of the examination and/or sample treatment ideas, please contact Patty Scheets at [patricia.scheets@gentiva.com](mailto:patricia.scheets@gentiva.com) or [plscheets@gmail.com](mailto:plscheets@gmail.com).

### DIAGNOSIS: MOVEMENT PATTERN COORDINATION DEFICIT

The primary movement dysfunction is the inability to coordinate an intersegmental task because of a deficit in timing and sequencing of one segment in relationship to another. The movement dysfunction in the lower extremity is primarily observed during postural control tasks and in the upper extremity during in hand manipulation and grasp and release of different objects coupled with reach. Motor performance typically improves with practice and instruction.

--	--	--	--	--

### DIAGNOSIS: FORCE PRODUCTION DEFICIT

The primary movement fault is weakness. The origin of the weakness may be muscle, neuromuscular junction, peripheral nerve, or central nervous system dysfunction. The presentation may be focal (one joint), segmental (generalized to an extremity or body region), or related to fatigue (of skeletal muscle rather than cardiopulmonary capacity).

--	--	--	--	---

### DIAGNOSIS: FRACTIONATED MOVEMENT DEFICIT

The primary movement dysfunction is the inability to fractionate movement associated with moderate or greater hyperexcitability. May describe the upper or lower extremity or both. Always associated with central neurological deficit.

Subjective/Medical History	Key Tests and Signs	Associated Signs	Differential Movement System Dx	Expected Outcome
<p><u>Associated Conditions:</u></p> <ul style="list-style-type: none"> <li>• Stroke</li> <li>• Brain Injury/hypoxia</li> <li>• Spinal Cord Injury (ASIA C or D)</li> <li>• Multiple Sclerosis</li> <li>⊕ Intraventricular Hemorrhage (IVH)</li> <li>⊕ Periventricular Luekomalacia (PVL)</li> <li>⊕ Brain Tumor</li> <li>⊕ Meningitis</li> <li>⊕ CP/static encephalopathy</li> </ul> <p><u>Pt / Caregivers May Report:</u></p> <ul style="list-style-type: none"> <li>• Stiffness of the limbs and/or pain</li> <li>⊕ Complicated perinatal history, ie documented PVL, IVH, hypoxic ischemic event</li> </ul>	<p><u>Movement:</u></p> <ul style="list-style-type: none"> <li>• Unable to fractionate movement</li> <li>• Slow; unable to make rapid reversals in movement</li> <li>• Unable to generate force rapidly</li> </ul> <p><u>Muscle Tone:</u></p> <ul style="list-style-type: none"> <li>• Moderate or greater hyperexcitability</li> <li>• Grade 3 or 4 on the modified Ashworth</li> </ul> <p><u>Reflex Testing:</u></p> <ul style="list-style-type: none"> <li>• May exhibit +ATNR, +STNR</li> </ul> <p><u>Task Analysis:</u></p> <ul style="list-style-type: none"> <li>• Consistent non-fractionated movement pattern across multiple tasks</li> </ul>	<p><u>Task Analysis:</u></p> <p><i>Pull to sit:</i></p> <ul style="list-style-type: none"> <li>⊕ Neck hyperextension with shoulder elevation</li> <li>⊕ May exhibit LE extension, adduction, and hip medial rotation (LE extensor pattern)</li> </ul> <p><i>Prone on elbows:</i></p> <ul style="list-style-type: none"> <li>⊕ Neck hyperextension with shoulder elevation</li> </ul> <p><i>Floor to stand:</i></p> <ul style="list-style-type: none"> <li>⊕ Pulls up with UEs with LEs extended; unable to fractionate or dissociate LE movements</li> </ul> <p><i>Sit to Stand:</i></p> <ul style="list-style-type: none"> <li>• Stiffness of involved limbs</li> <li>• Slow</li> <li>• No dissociation of movement at one joint from movement at another</li> <li>• May see associated reactions with increased effort</li> <li>• In forms with less anti-gravity movement, unable to stand</li> </ul>	<ul style="list-style-type: none"> <li>• Force Production Deficit</li> </ul>	<ul style="list-style-type: none"> <li>• Related to degree of antigravity movement</li> <li>• In forms with more antigravity movement, stability in sitting and with reaching; ambulation in home and community with significant deviations and significant reduction in speed with or without a cane; ascend/descend stairs step-to with or without a railing</li> <li>• In forms with 4 limb involvement wheelchair for locomotion (probably electric)</li> <li>• Able to use UE as “assist” with ADL</li> </ul>

		<p><i>Creeping:</i></p> <ul style="list-style-type: none"> <li>• May exhibit bunny hopping or commando crawling rather than assuming a 4-point position</li> </ul> <p><i>Gait:</i></p> <ul style="list-style-type: none"> <li>• Compensatory movement strategy of hip hiking, vaulting, or circumduction to initiate swing of involved extremities</li> <li>• Stiffness of hip/knee flexion during swing</li> <li>• Scissoring</li> <li>• “toe walking” or “equinus gait”</li> <li>• Hip and knee often flexed during stance of involved extremities</li> <li>• Likely to require AFO to control foot position for weight bearing</li> <li>• Likely to require assistive device at least early in course</li> <li>• In forms with less anti-gravity movement, unable to stand</li> </ul> <p><i>Reach and Grasp:</i></p> <ul style="list-style-type: none"> <li>• Able to reach in very limited range (&lt; 60-90°)</li> <li>• Hand closure with minimal relaxation or minimal opening</li> <li>• Finger flexion associated with wrist flexion and pronation</li> </ul> <p><u>Postural Control:</u></p>		
--	--	--	--	--

		<ul style="list-style-type: none"><li>• In forms with more antigravity movement, able to sit unsupported but asymmetrically or with posterior pelvic tilt (sacral sitting) and hip medial rotation with compensatory thoracic flexion</li><li>• Stability may improve with practice but symmetry will not</li></ul>		
--	--	---	--	--

**DIAGNOSIS: POSTURAL VERTICAL DEFICIT**

The primary movement dysfunction is inaccurate perception of vertical orientation resulting in postural control deficits and the tendency to **resist correction of center of mass alignment**. The condition may be in the medial/lateral or anterior/posterior direction.

Subjective/Medical History	Key Tests and Signs	Associated Signs	Differential Movement System Dx	Expected Outcome
<p><u>Associated Conditions:</u></p> <ul style="list-style-type: none"> <li>Stroke (med/lat)</li> <li>Brain Injury (med/lat)</li> <li>Psychomotor Disadaptation Syndrome (ant/post)</li> <li>Backward Disequilibrium (ant/post)</li> <li>Rhett's Syndrome</li> </ul> <p><u>Pt / Caregiver May Report:</u></p> <ul style="list-style-type: none"> <li>Backward falls</li> <li>Fear of falling</li> <li>Visual or visual perceptual deficits</li> </ul>	<p><u>Postural Control:</u></p> <ul style="list-style-type: none"> <li>Shifts center of mass beyond limits of stability to side or backward without weight acceptance</li> <li><b>Resists correction or becomes fearful/agitated when center of mass alignment is corrected</b></li> <li>Deficits may present in sitting, standing, or with walking depending on severity</li> </ul> <p><u>Perception:</u></p> <ul style="list-style-type: none"> <li>Sensation of "falling" when shifted toward correct vertical alignment</li> <li>May have disregard or neglect of involved extremities</li> </ul>	<p><u>Movement:</u></p> <ul style="list-style-type: none"> <li>Presentation is variable although movement in at least 60% of muscle groups in the LE is expected</li> <li>Movement may not be fractionated</li> </ul> <p><u>Motor Planning:</u></p> <ul style="list-style-type: none"> <li>May have difficulty planning or organizing movement patterns into purposeful actions</li> </ul> <p><u>Sensation:</u></p> <ul style="list-style-type: none"> <li>Likely to be impaired to light touch and joint position sense (med/lat)</li> </ul> <p><u>Behavior:</u></p> <ul style="list-style-type: none"> <li>Impulsive</li> <li>Poor judgment</li> <li>Fear avoidance behavior such as clutching or grabbing with UE and shifting base of support</li> </ul>	<ul style="list-style-type: none"> <li>Sensory Selection and Weighting Deficit</li> <li>Sensory Detection Deficit</li> <li>Fractionated Movement Deficit</li> <li>Force Production Deficit</li> </ul>	<ul style="list-style-type: none"> <li>Related to severity of behavioral/cognitive deficits, motor function, and natural recovery of perceptual deficit</li> <li>Assisted ambulation with uncomplicated devices such as wheeled walker or along a wall</li> <li>Many are non-ambulatory and require significant assistance with transfers</li> </ul>

### DIAGNOSIS: SENSORY SELECTION AND WEIGHTING DEFICIT

The primary movement dysfunction is the inability to maintain postural orientation or motor performance as a result of decreased ability to screen for and attend to appropriate sensory inputs. Patients may demonstrate sensory seeking or sensory avoidance behaviors.

Subjective/Medical History	Key Tests and Signs	Associated Signs	Differential Movement System Dx	Expected Outcome

--	---	--	--	--

### DIAGNOSIS: SENSORY DETECTION DEFICIT

The primary movement dysfunction is the inability to execute intersegmental movement due to lack of joint position sense or multi-sensory failure affecting joint position sense, vision, and/or the vestibular system. May involve UE, LE, or both.

Subjective/Medical History	Key Tests and Signs	Associated Signs	Differential Movement System Dx	Expected Outcome

--	--	--	--	--

**DIAGNOSIS: HYPOKINESIA**

The primary movement dysfunction is related to slowness in initiating and executing movement. May be associated with stopping of ongoing movement.

Subjective/Medical History	Key Tests and Signs	Associated Signs	Differential Movement System Dx	Expected Outcome

### DIAGNOSIS: DYSMETRIA

The primary movement dysfunction is related to the inability to grade forces appropriately for the distance and speed aspects of a task. Rapid movements are generally too large, and slow movements are generally too small for their intended purpose. Performance deteriorates with faster speeds. May involve UE, LE, or both. Generally associated with cerebellar dysfunction.

**CLASSIFICATION: COGNITIVE DEFICIT**

The primary deficit in movement is impaired motor control related to lack of arousal, attention, or ability to apply meaning to situation that is appropriate for age.
