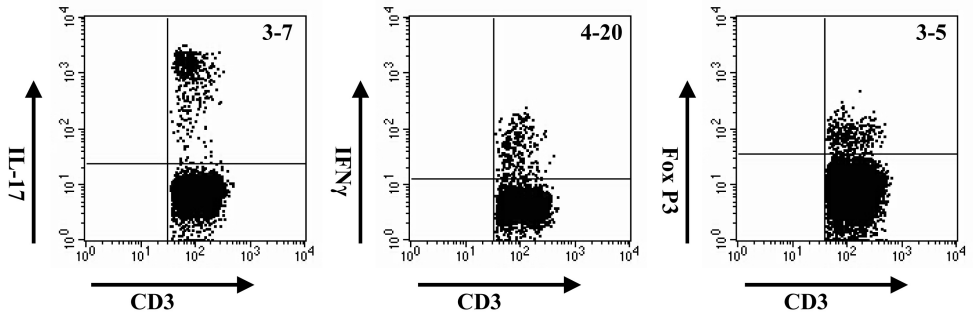
Supplementary Figure 1: Renal T-cell subsets in nephrotoxic nephritis



Representative intracellular staining assessed by flow cytometry for production of IL-17, IFNγ and FoxP3 in renal T cells 10 days after induction of nephritis. The analysis revealed that about 3-7 % of CD3+ T cells are IL-17 positive (identifying them as Th17 cells), 4-20 % are INFγ positive (identifying them as Th1 cells) and 3 -5 % are FoxP3 positive cells (identifying them as regulatory T cells).
