§ Definition by the Danish Health Authority.¹

¶ Definition by Davydow DS et al.²

* Potentially preventable hospitalization.

† Area under the ROC curve.

‡ Average precision.

GP, general practitioner; COPD, Chronic obstructive pulmonary disease; CVD, Cardiovascular disease.

Table 7. Evaluation of the predictive performance of models for potentially preventable hospitalizations within the following year among 189,514 unique citizens aged 18+ years at 910,366 contacts with general practitioners resulting in 19,932 (2.2%) potentially preventable hospitalizations according to the definition by Davydow et al in the CROSS-TRACKS cohort in 2016-2017.

Predictors included in the models:

Baseline model: age and gender.

Model 1: Baseline model + cohabitation status, socioeconomic status, municipality care, and contacts with primary healthcare.

Model 2: Model 1 + Charlson Comorbidity Index disease groups, prescription medicine by ATC code, and blood tests.

Model 3: Model 2 + contacts with secondary healthcare, diagnoses, procedures, vital parameters, BMI, smoking status, and alcohol intake.

† Area under the ROC curve.

‡ Average precision.

Touch points are daytime consultations with general practitioners. The figure shows an individual with five touch points and two potentially preventable hospitalizations.
