

Health-related Quality of Life Among Children with Cystic Fibrosis-related Liver Disease

The influence of early liver involvement on health-related quality of life (HRQoL) in asymptomatic children with cystic fibrosis (CF) is unclear

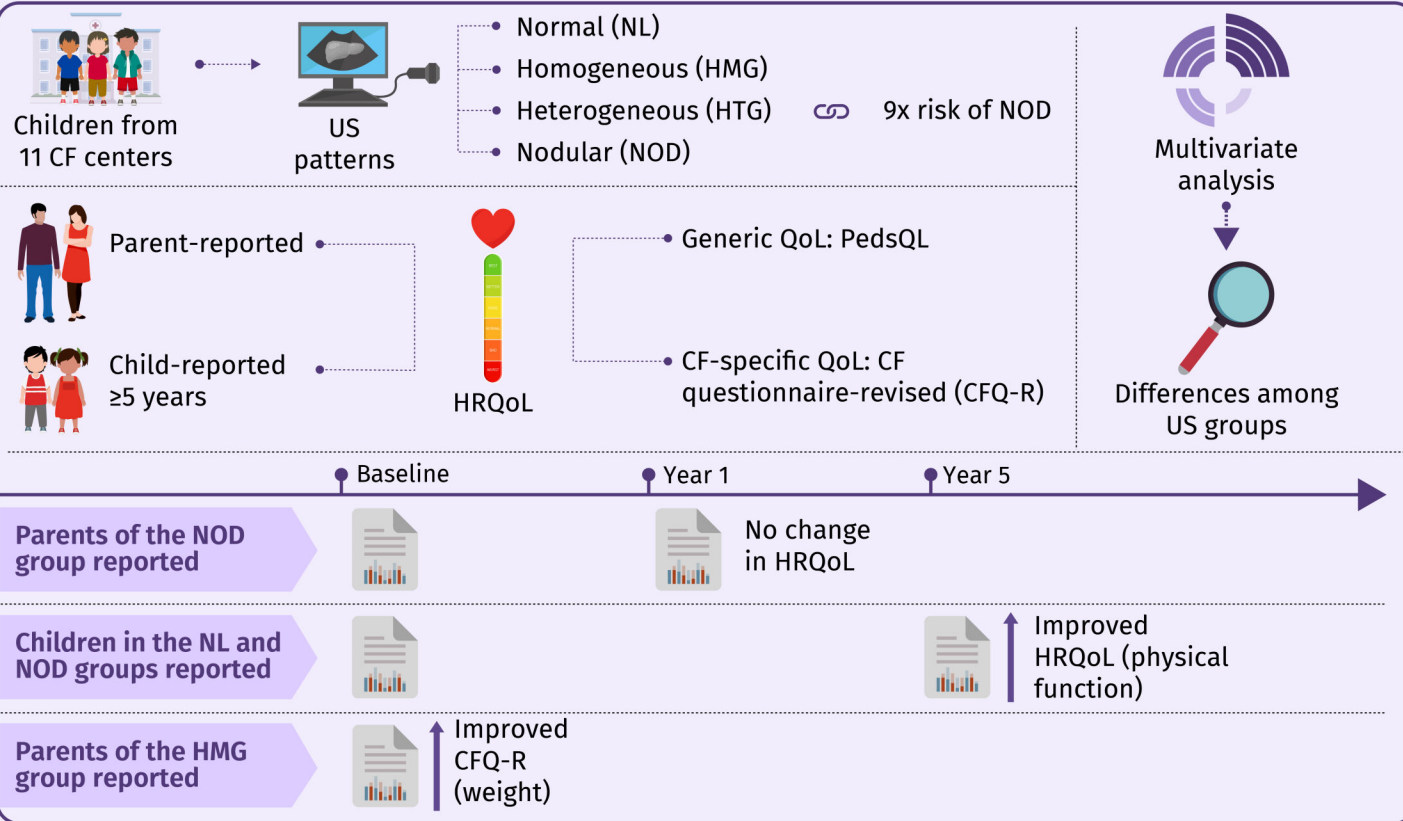

Multicenter, prospective study to assess the impact of cystic fibrosis-related liver disease (CFLD) on HRQoL

515 children:
Baseline ultrasound
(US) and HRQoL data

191 children:
Longitudinal
group

Sharing US findings may not impact HRQoL, and children with early CFLD can have stable HRQoL regardless of liver involvement
