

Suppl Figure. Funnel plot of the standard error (SE) and standardized effect for each study. The angled dotted lines define the area including 95% of the standardized mean differences (SMD). The vertical line defines the middle of the funnel. Visual inspection of the funnel plot shows three studies fall below 95% CI, whereas 5 studies are above. Egger's regression test suggests there is no significant asymmetry of the plot ($p=0.07$).
