#### BLOOD-FILLED PRESSURE ULCER BLISTER

According to Minimum Data Set 3.0, this blood-filled pressure ulcer blister of the right inner heel requires a comprehensive assessment of not only the blister but also the skin around the blister. If there are no signs of tissue compromise in the area surrounding the blister, it would be documented as stage 2 (section M0300B). However, the National Pressure Ulcer Advisory Panel criteria would consider this deep tissue injury.
