Figure A1. Average reading curves after the correction for learning. Each curve represents group average estimation. The error bars represent the average +/- 68.2% half width of the credible intervals across observers. Average areas under the curve are listed for all five blocks in each panel. The standard deviations of the areas under the curve across the five blocks are 0.01, 0.01, 0.02 $(log10)^2$ units for the one-session within-design, five-session within-design, and five-session between-design conditions, respectively. The corresponding coefficients of variation are 0.58%, 0.57%, and 0.97%.
