

Supplemental Figure 1. Representative images used for quantitation of gland/total area. Overall regions selected (total area=denominator) are demarcated in green. Glands are demarcated in yellow (gland area=numerator). Areas considered to represent artefactual spaces between fragments or invaginated surface/lumen and not true glands are demarcated in red and subtracted from total area. Calculated percent of total area comprised by glands is shown in parentheses for each panel. Areas with marked specimen fragmentation were avoided (e.g., Pt 5, 6).
