

**Supplemental Digital Content 5, Figure S4: Plasma and CSF sCD14, CCL2, and IL-6 levels**

**do not distinguish between subjects with and without HAND or NPI-O clinical diagnoses.**

Plasma and CSF sCD14, CCL2, and IL-6 levels were compared between subjects with no neurocognitive impairment (no NCI, n=19) and subjects with HAND or NPI-O (n=44). No differences were found for any of the markers tested. Median values are indicated as horizontal lines. Statistical significance between groups was calculated using the Mann-Whitney test.
