TABLE S1. Morphologic lesions assessed in two independent pathologist evaluations - correlations with MRI parameters.

Morphologic parameters	Cortical T1 relaxation time		ΔADC		Cortical T2 relaxation time	
	rho	P	rho	P	rho	P
Prospective evaluation (two nephropathologists)^a						
Interstitial fibrosis (ci)	0.388	0.028	-0.475	0.007	0.063	0.73
% interstitial fibrosis	0.449	0.010	-0.490	0.005	0.152	0.41
Tubular atrophy (ct)	0.505	0.003	-0.414	0.021	0.176	0.34
Separate re-evaluation (independent pathologist)^a						
Interstitial fibrosis (ci)	0.482	0.005	-0.388	0.031	0.065	0.72
% interstitial fibrosis	0.493	0.004	-0.388	0.031	0.080	0.66
Tubular atrophy (ct)	0.484	0.005	-0.326	0.074	0.063	0.73

ADC, apparent diffusion coefficient; ΔADC, cortico-medullary difference of ADC; MRI, magnetic resonance imaging; rho, correlation coefficient.

^aStudy biopsies were evaluated prospectively by two nephropathologists blinded to MRI results (H.R., J.K.). For assessment of inter-observer variability, specimens were re-evaluated by a third independent pathologist (M.N.).

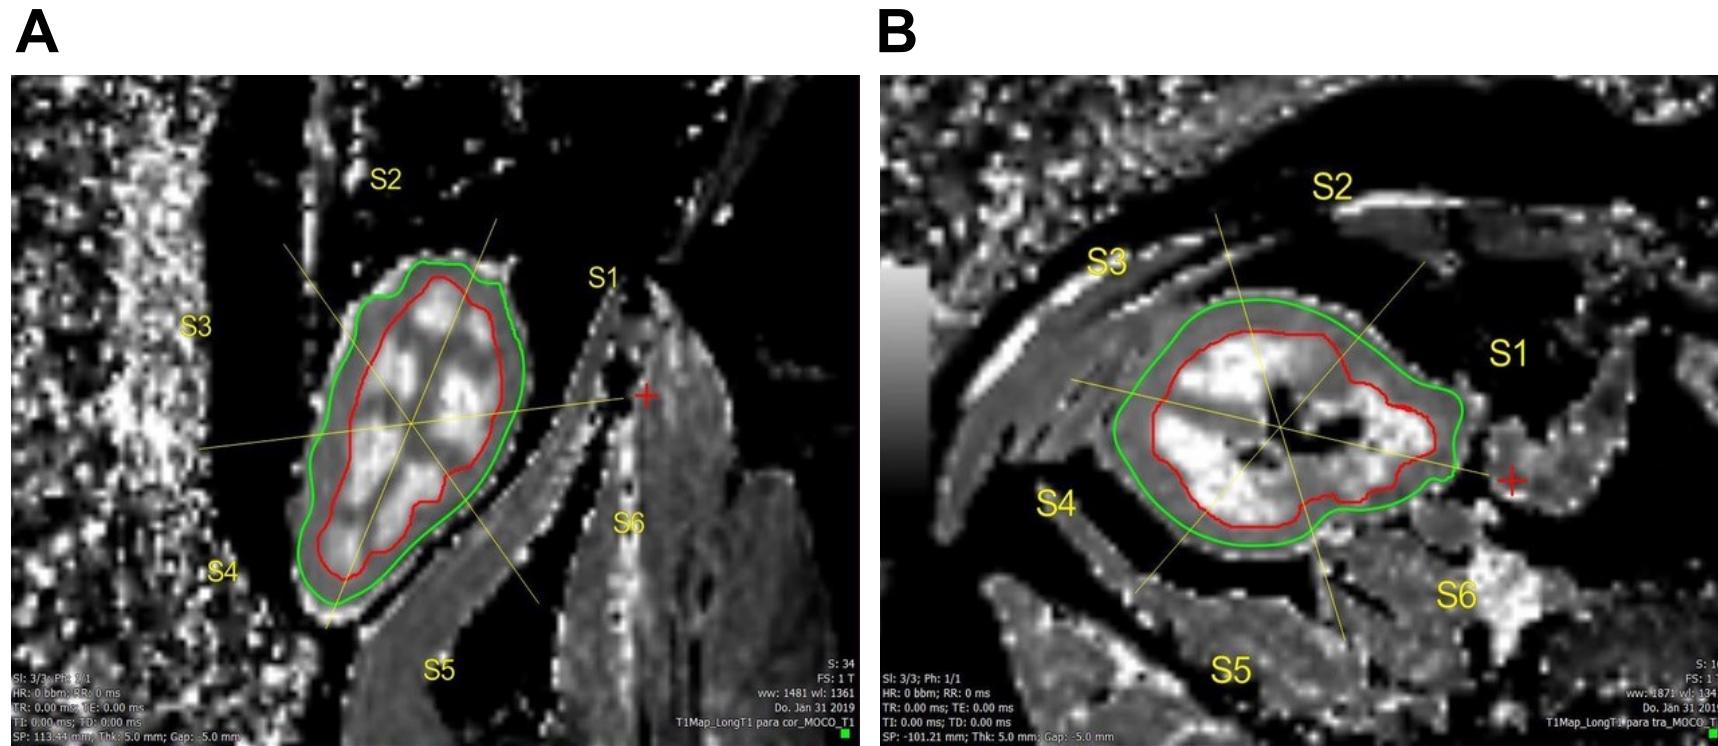

Figure S1. Representative example of T1-weighted MRI of a kidney allograft in coronal and axial slices. MRI scans are shown for a representative study subject with low grade interstitial renal allograft fibrosis on histology (ci0). Representative coronal (A) and axial slices (B) are shown. Green and red lines indicate the outer and inner margins of the renal cortex, respectively. Each slice was divided in 6 segments (S1-S6). T1 relaxation time was measured for each of the segments.
